

Technique:

Detection principle:

Abstract:

SGARFACE is sensitive to 0.1ms to 100 ms bursts of γ -rays with $E > 200 \text{ MeV}$. The detection of low energy γ -ray bursts is provided by the accumulative Cherenkov-light of a large number of low energy showers arriving within a short time. The fluence sensitivity is 2- 3 orders of magnitude higher than previous satellite telescopes (EGRET).
