Energy budget

* **Gravitational energy**

$$E_g \sim \frac{GM_{\rm NS}^2}{R_{\rm NS}} = 2.6\times10^{53}\,{\rm erg}\left(\frac{M_{\rm NS}}{M_\odot}\right)^2\left(\frac{R_{\rm NS}}{10{\rm km}}\right)^{-1}$$

* **Kinetic energy of ejecta**

$$E_K \sim \frac{1}{2}M_{\rm ej}v_{\rm ej}^2 = 10^{51}\,{\rm erg}\left(\frac{M_{\rm ej}}{10M_\odot}\right)\left(\frac{v_{\rm ej}}{3000\,{\rm km/s}}\right)^2$$

* **Radiation energy (“supernova”)**

$$E_\gamma \sim M_{\rm Ni}c^2\times f_{\rm Ni\to Fe} = 2\times10^{49}\,{\rm erg}\left(\frac{M_{^{56}Ni}}{0.1M_\odot}\right)\left(\frac{f_{\rm Ni\to Fe}}{0.013\,\%}\right)$$

$$E_g \approx E_\nu \gg E_K \gg E_\gamma$$

“Supernova”

Neutrino is crucial for explosion mechanism

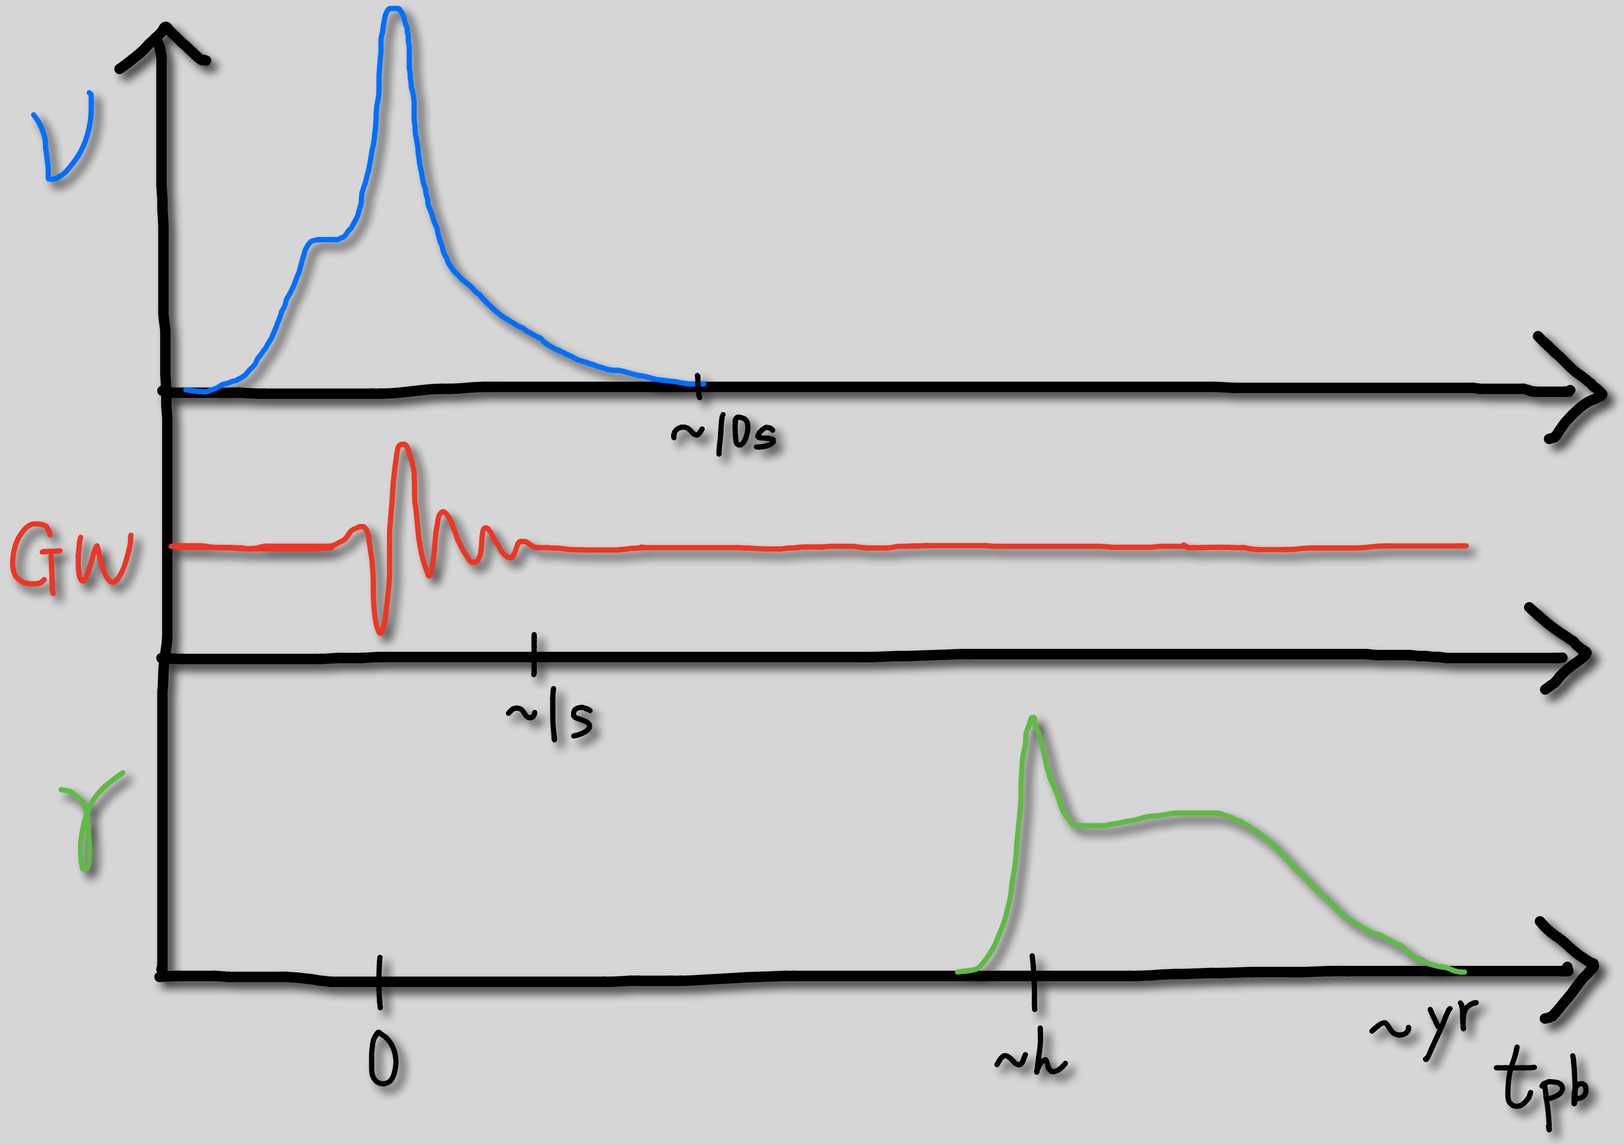
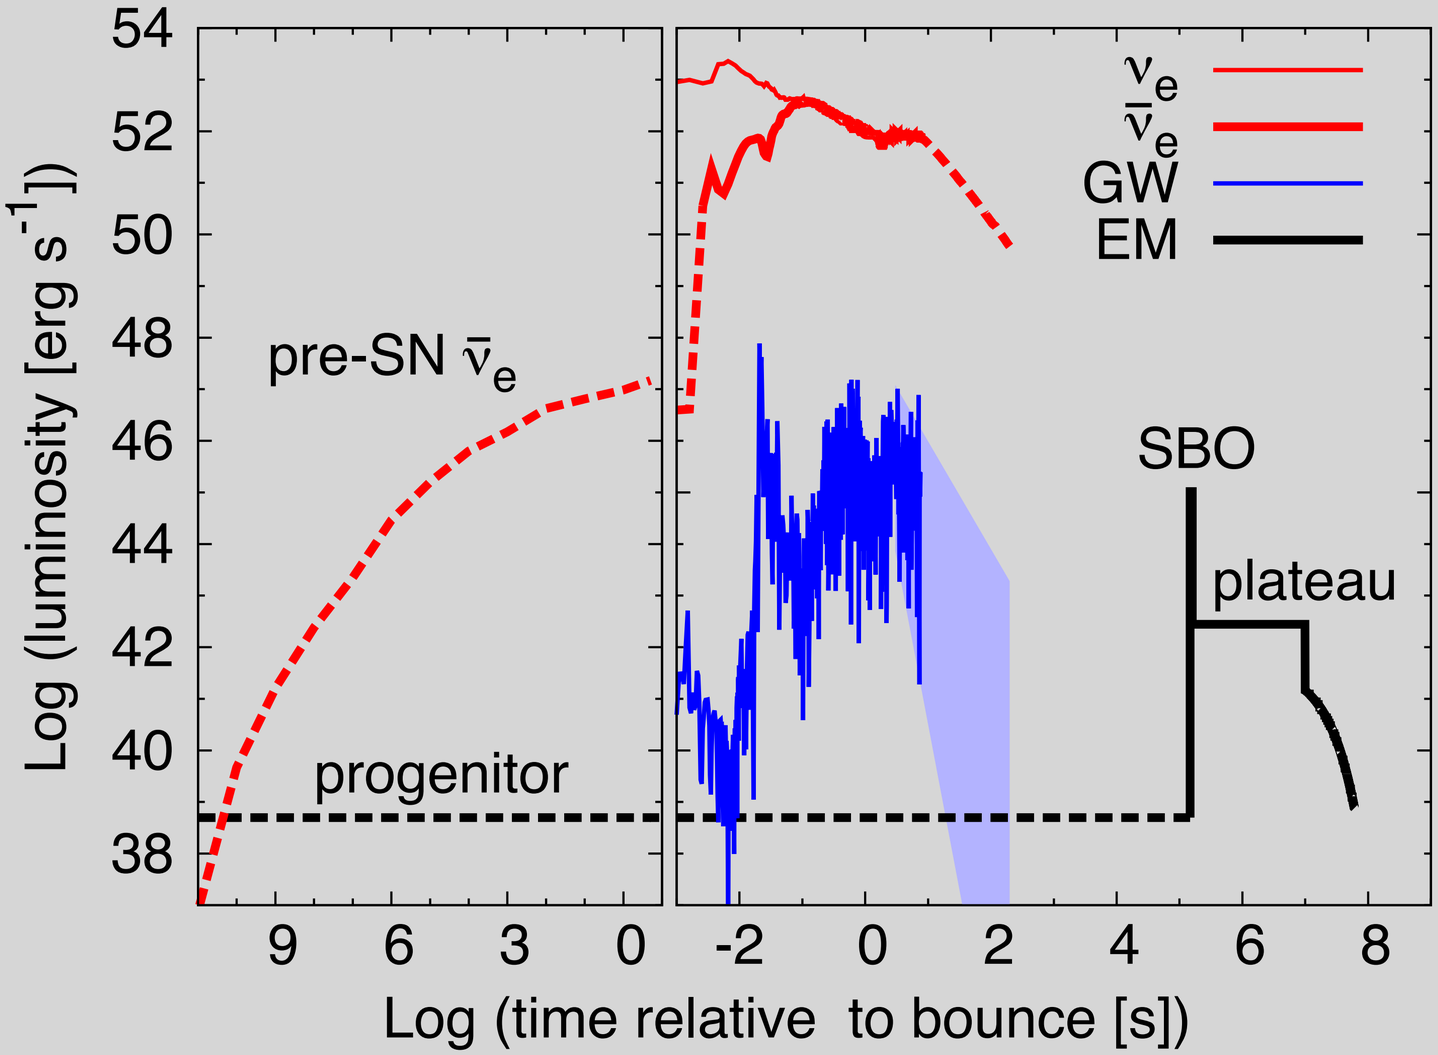
(Apr. 2013)

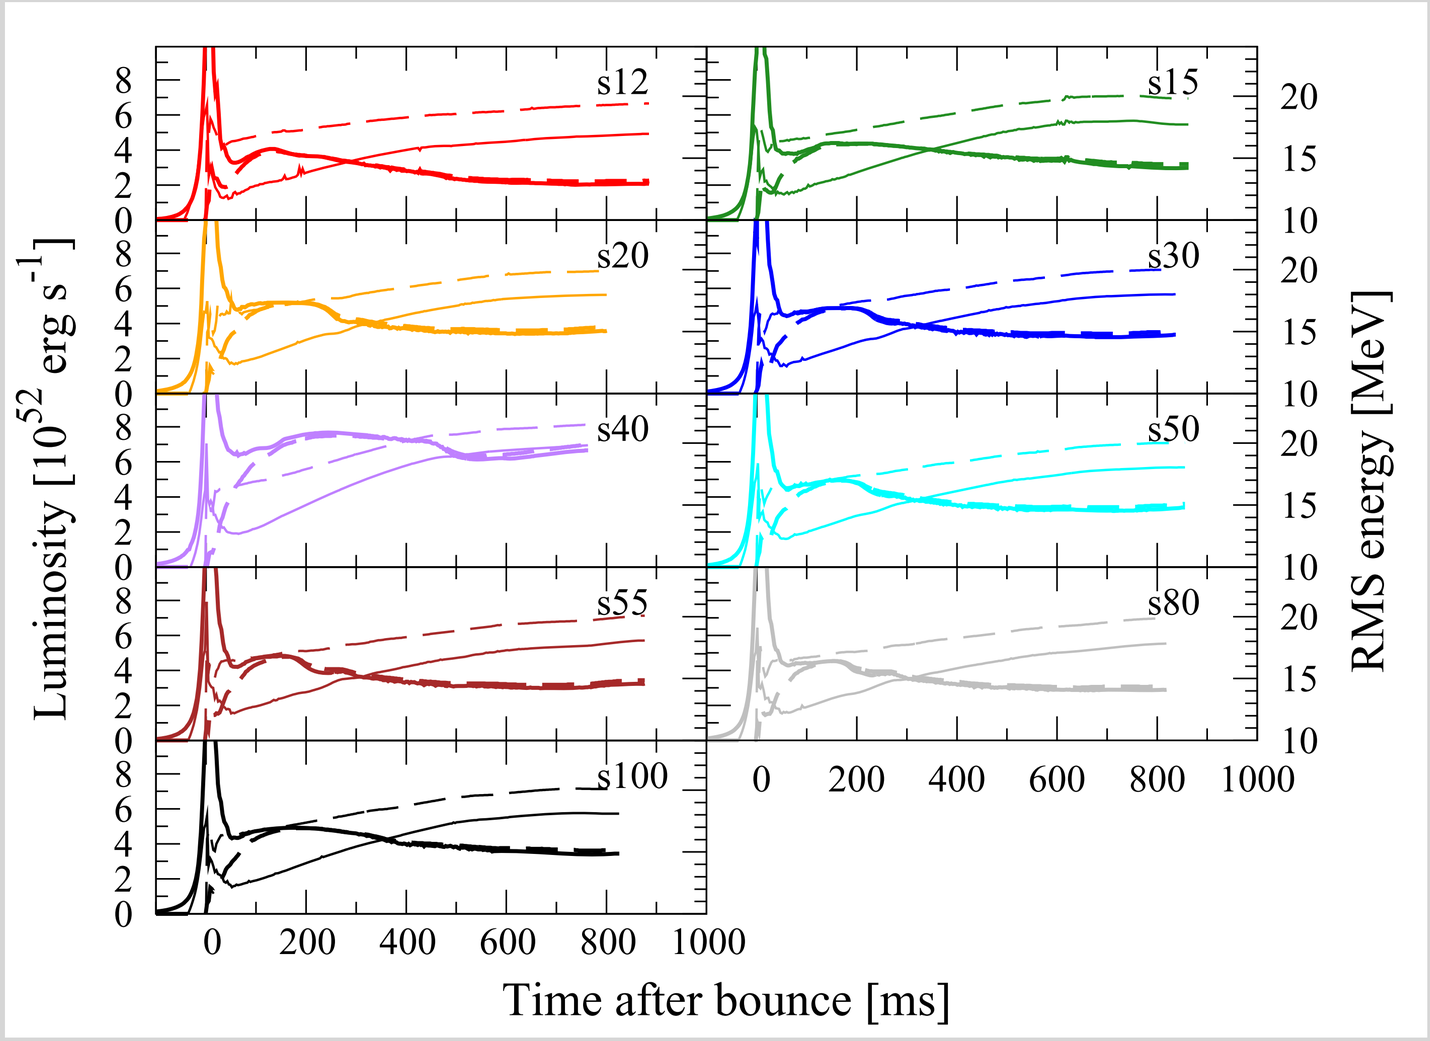


Multi-messenger time domain astronomy of CCSN

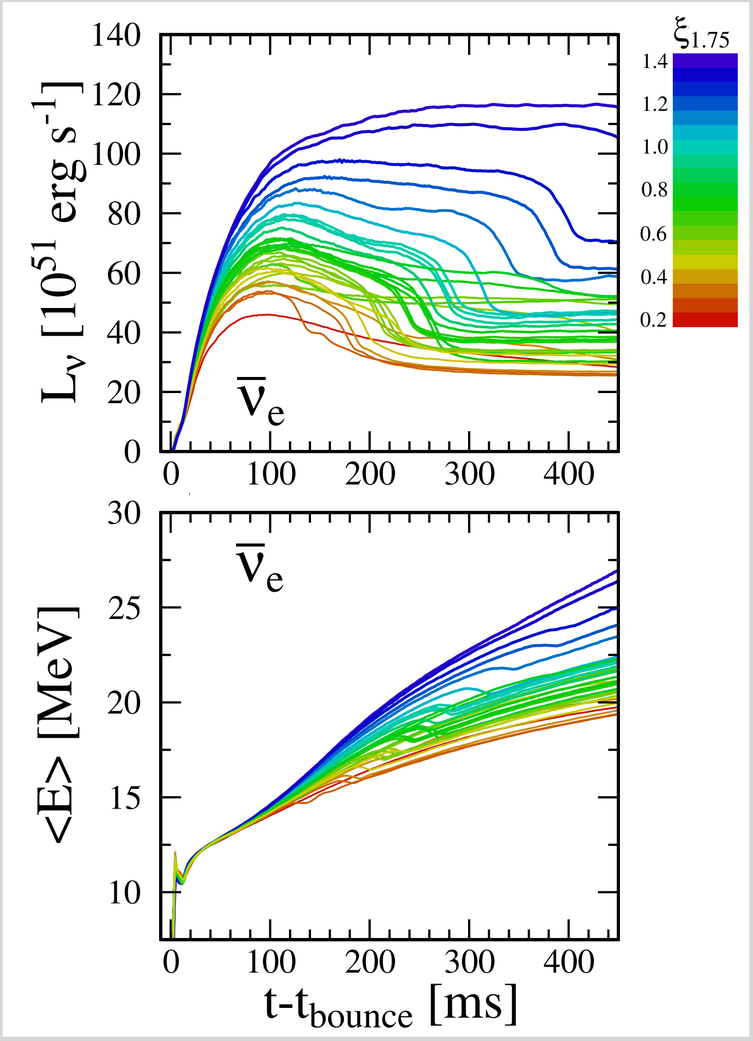


Nakamura+ 2016

Theoretical prediction: neutrino signals are robust

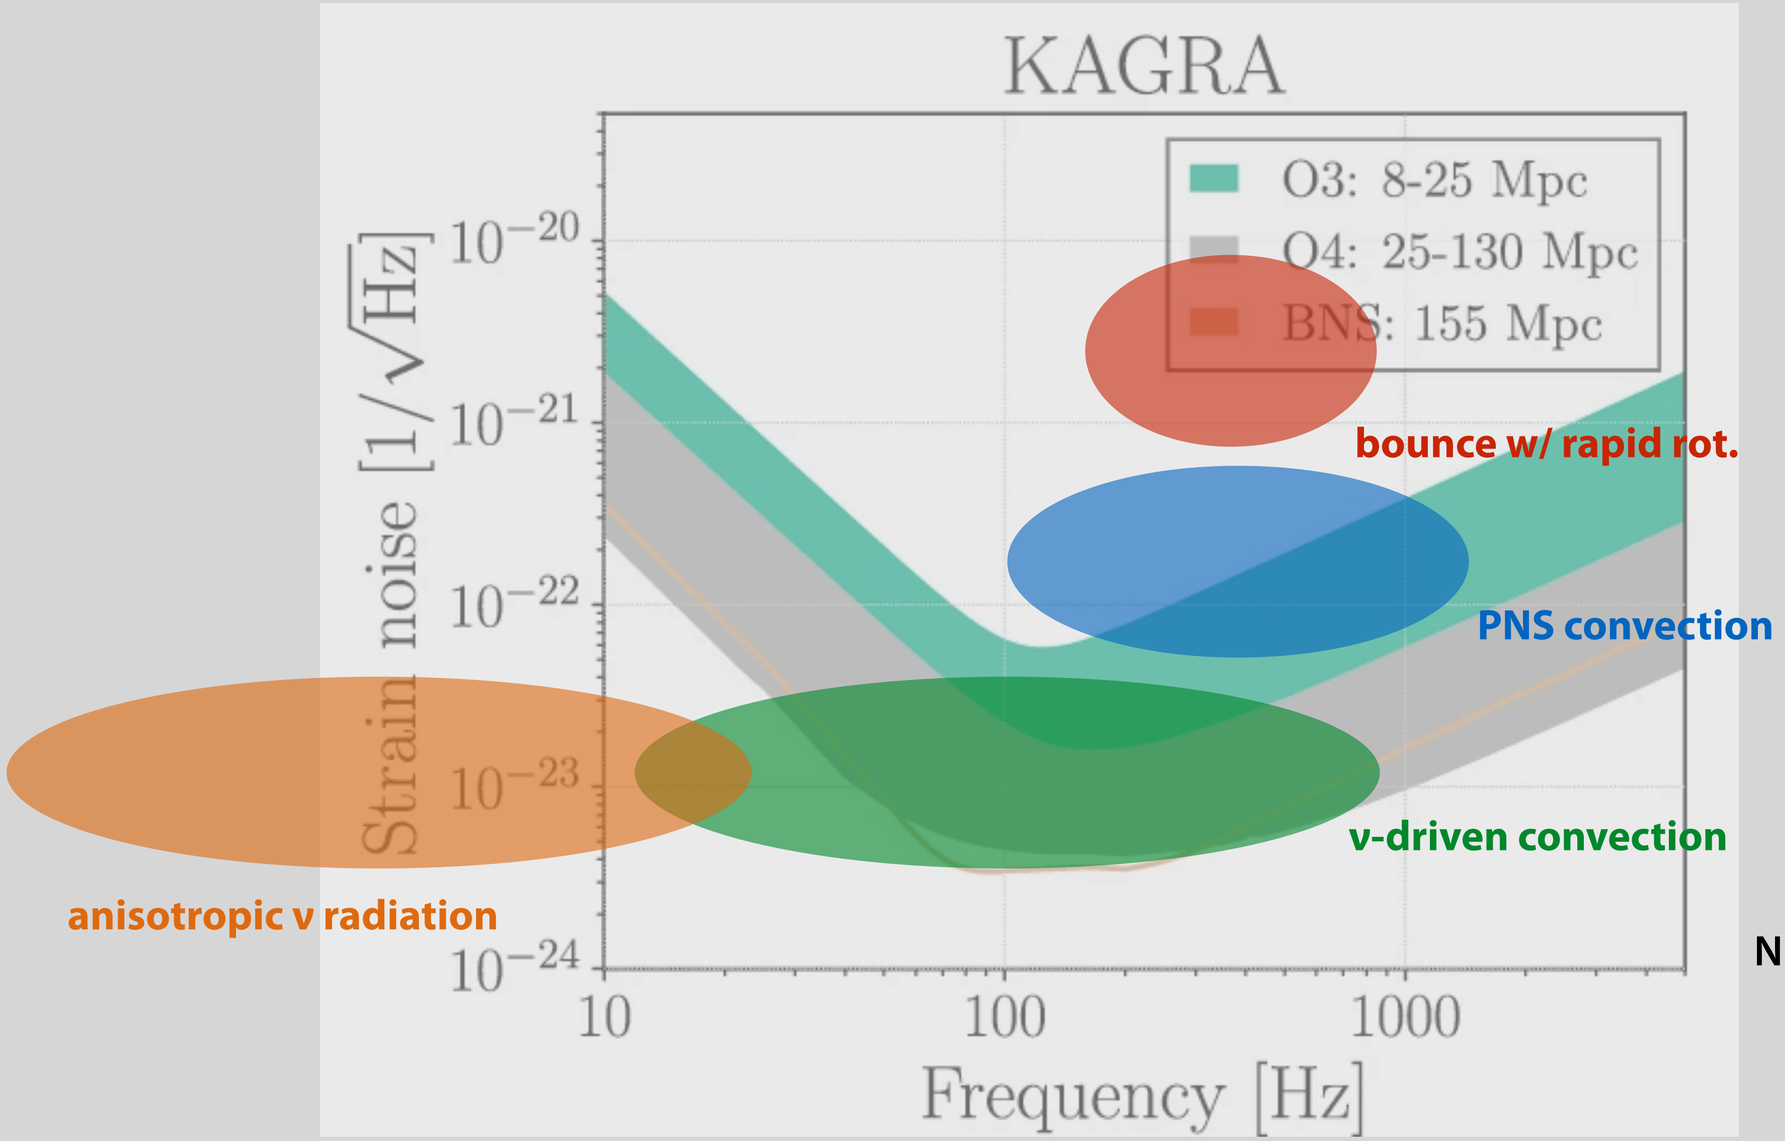


Suwa+ 2016



O'Connor & Ott (2013)

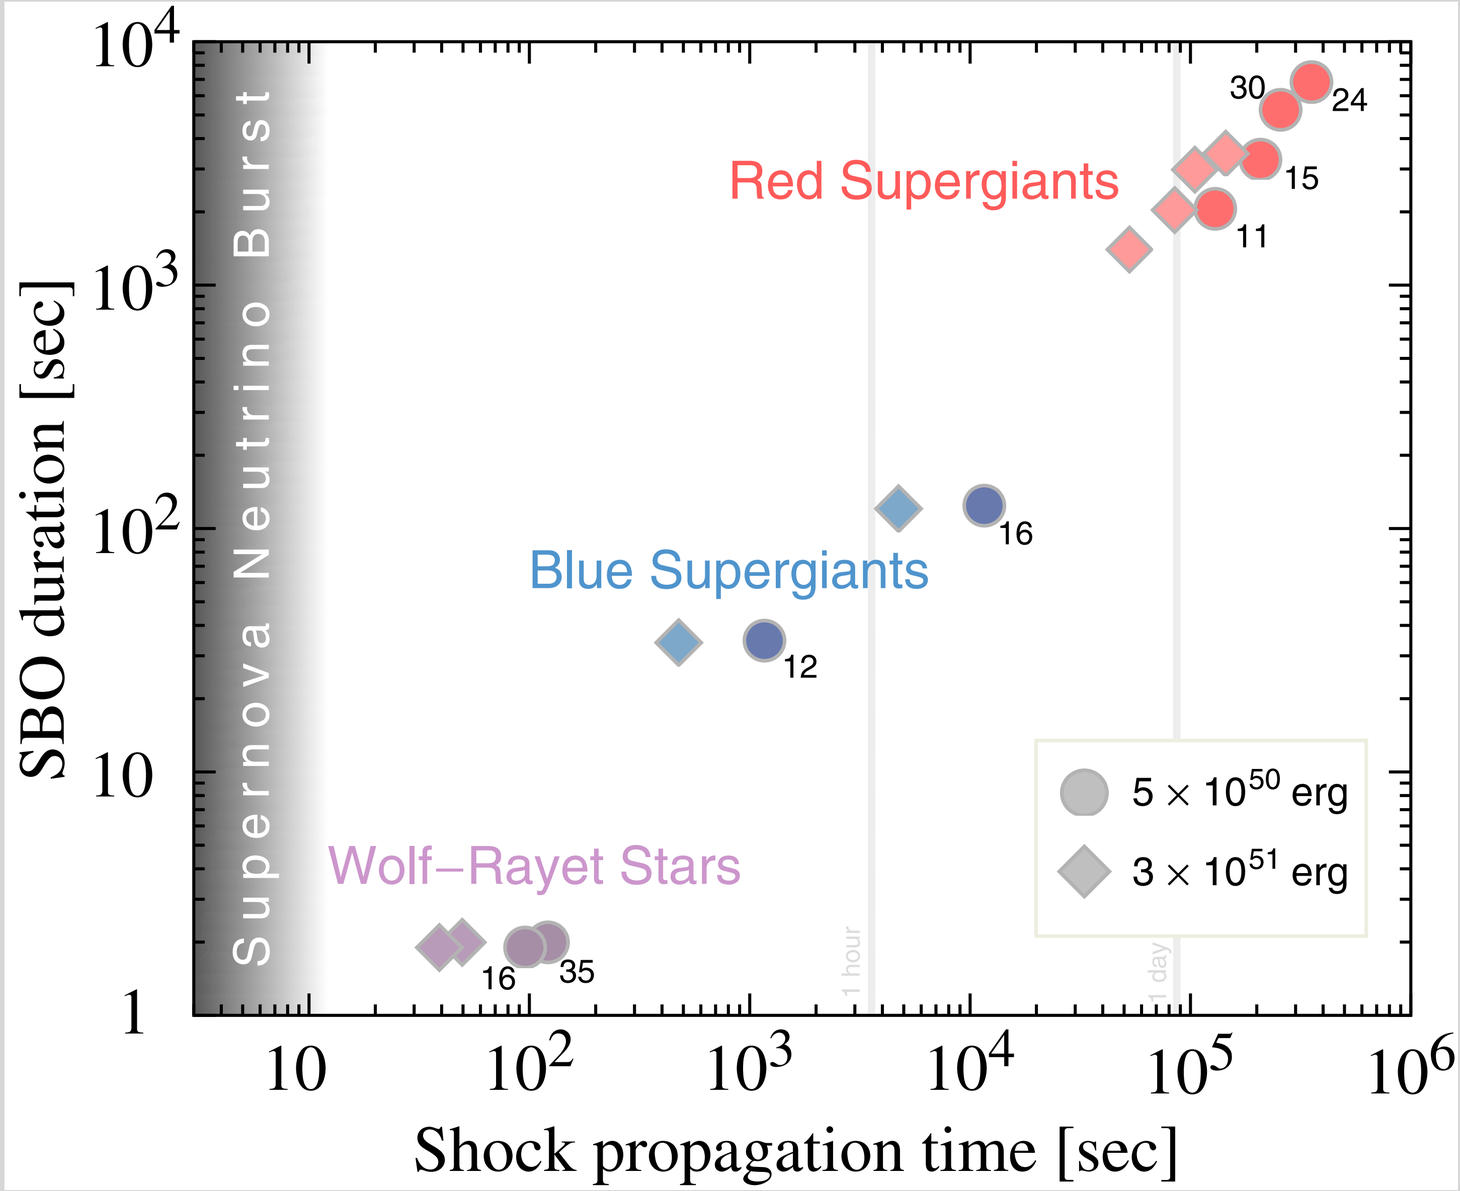
Theoretical prediction: gravitational waves are not robust



Abbott+, LRR (2020)

NB) both frequency and amplitude are highly model dependent (cf. dimensionality, EOS, neutrino interactions)

Theoretical prediction: optical emission may come early



Kistler+ 2013

Ideal scenario

1. ν → discovery (Si burning phase, neutronization burst, PNS cooling phase)

- angular resolution ~ degree
- circulate detection worldwide

2. EM → confirm (shock breakout, diffusion cooling, Co decay)

- delay for ~ mins to days, depending on progenitor radius
- follow up observation from radio to gamma-ray

3. GW → SN physics (bounce, PNS convection, quasi-periodic oscillation, memory effect)

- time coincidence with ν (and spacial coincidence?)
- even non-detection can put constraint on explosion mechanism

Requirement for observational facilities

* **Neutrino: SK-Gd, KamLAND, IceCube, HK**
  - **promising signal !**
  - high duty cycle strongly demanded
  - good time resolution is necessary for GW
  - good position resolution is necessary for γ
* **Photon: Optical** (Subaru, etc.)**, X-ray** (MAXI, etc.)
  - **necessary to confirm as an astronomical object**
  - due to different spacial resolutions and FOV, the blind search might be necessary for large telescopes
* **Gravitational wave: LIGO, Virgo, KAGRA**
  - **necessary to see the innermost part**
  - smoking gun judging the explosion mechanism
  - burst search method should be improved to put a strong constraint

What is needed for multi-messenger observations?

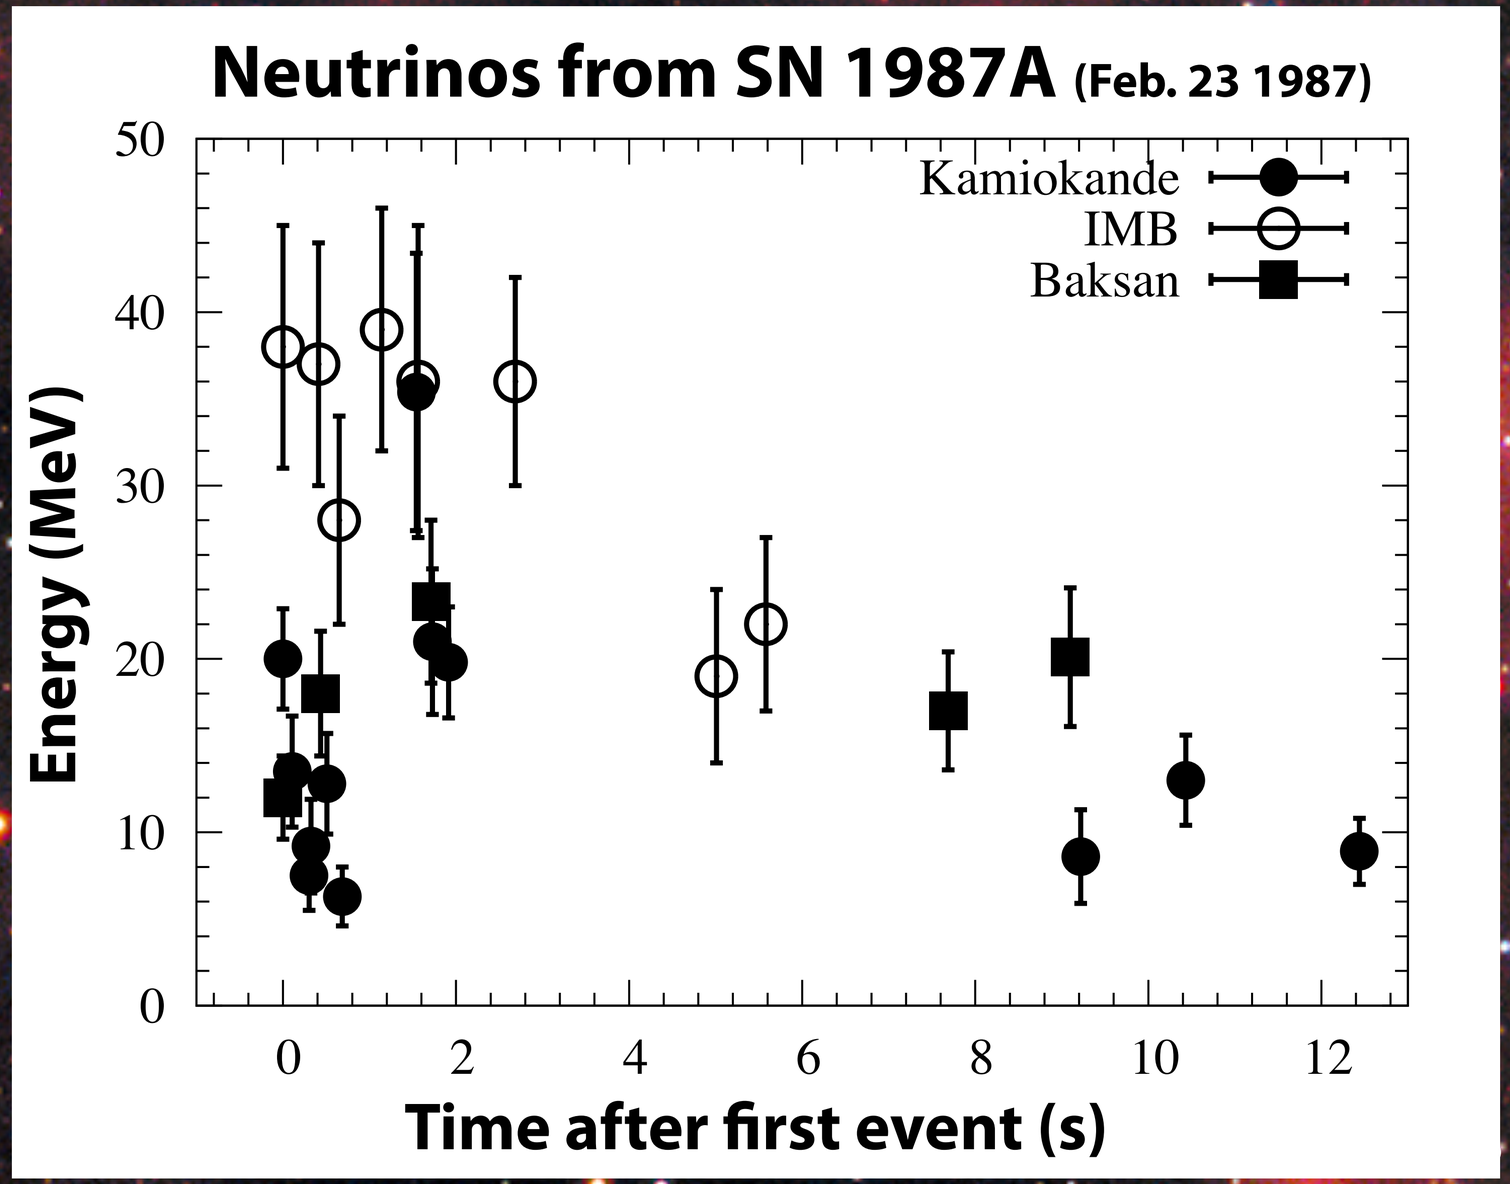
How to deal with SN neutrinos

SN1987A



NASA/ESA

What can we extract from neutrino observations?

- **Properties of neutron stars**
  - **Binding energy**
    - *important for energetics, done with SN1987A*

$$E_b \approx \frac{GM_{\rm NS}^2}{R_{\rm NS}} = \mathcal{O}(10^{53}){\rm erg}\left(\frac{M_{\rm NS}}{1.4M_\odot}\right)^2\left(\frac{R_{\rm NS}}{10{\rm km}}\right)^{-1}$$

  - **Mass**
    - *important for discriminating final object (NS or BH)*
  - **Radius**
    - *important for discriminating nuclear equation of state*

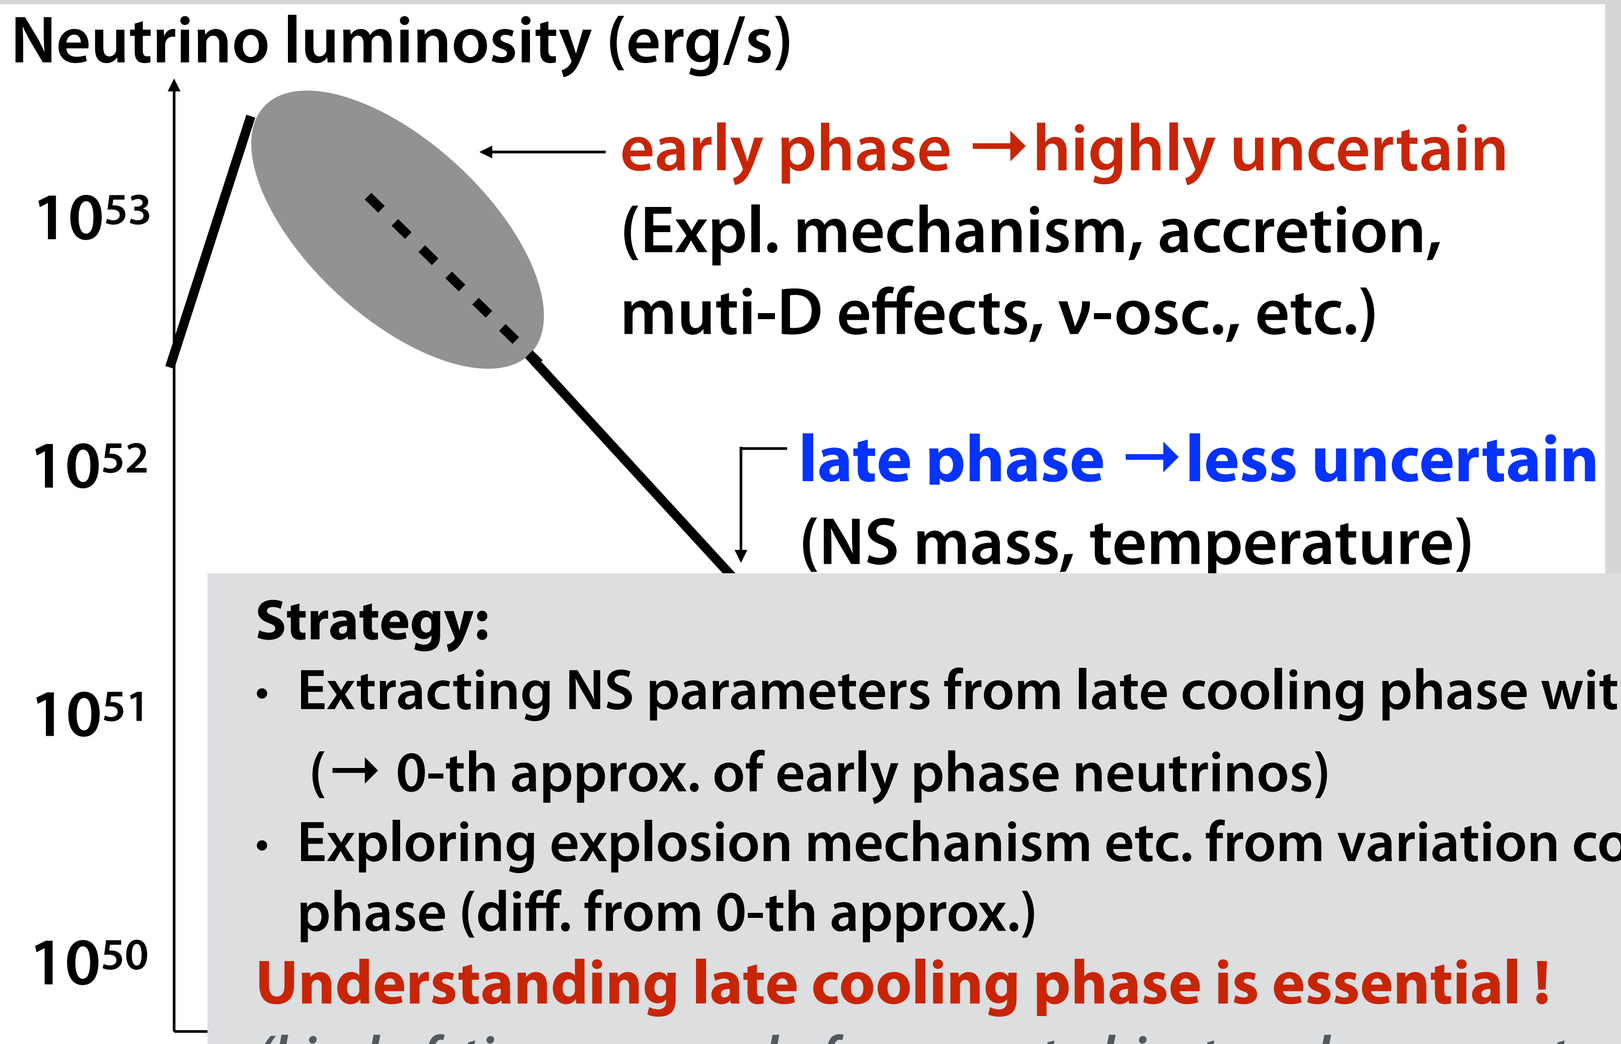
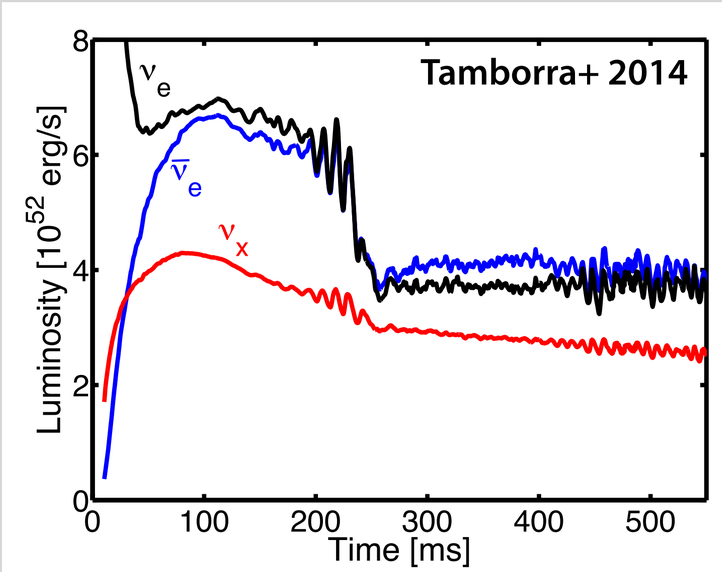
Late cooling phase is simpler and more understandable than early phase



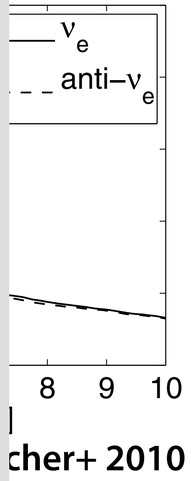


Strategy:

- Extracting NS parameters from late cooling phase with small uncertainties
  (→ 0-th approx. of early phase neutrinos)
- Exploring explosion mechanism etc. from variation component of early phase (diff. from 0-th approx.)

Understanding late cooling phase is essential !

(kind of time-reversal of compact object coalescence strategy)



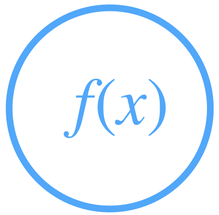
3 Steps

step 1

NUMERICAL SIMULATIONS

- Cooling curves of PNS
- Detailed physics included
- Discrete grid of data set
- Computationally expensive

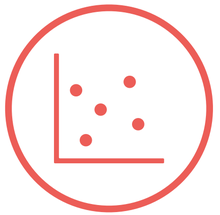
step 2



ANALYTIC SOLUTIONS

- Analytic cooling curves
- Calibrated w/ numerical sol.
- Simplified but essential physics included
- Fast and continuous

step 3



DATA ANALYSIS

- Mock sampling
- Analysis pipeline for real data
- Error estimate for future observations

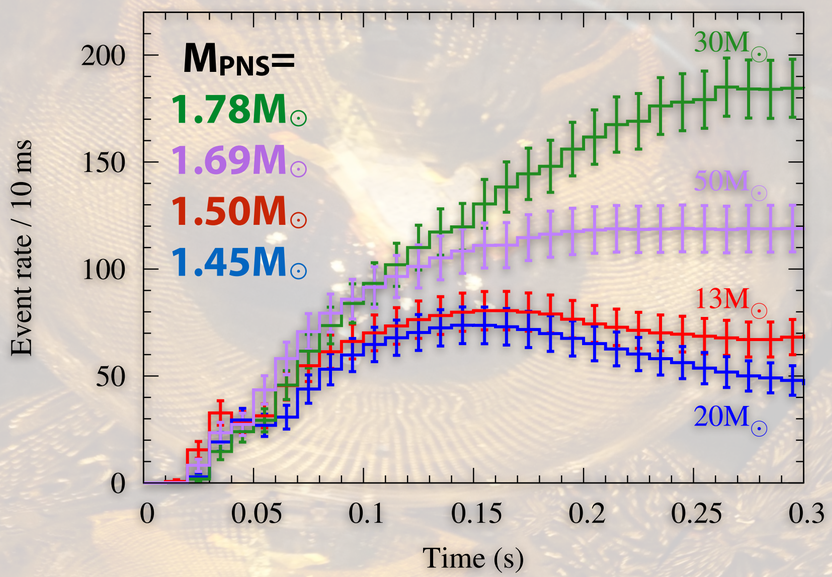
Event rate evolution

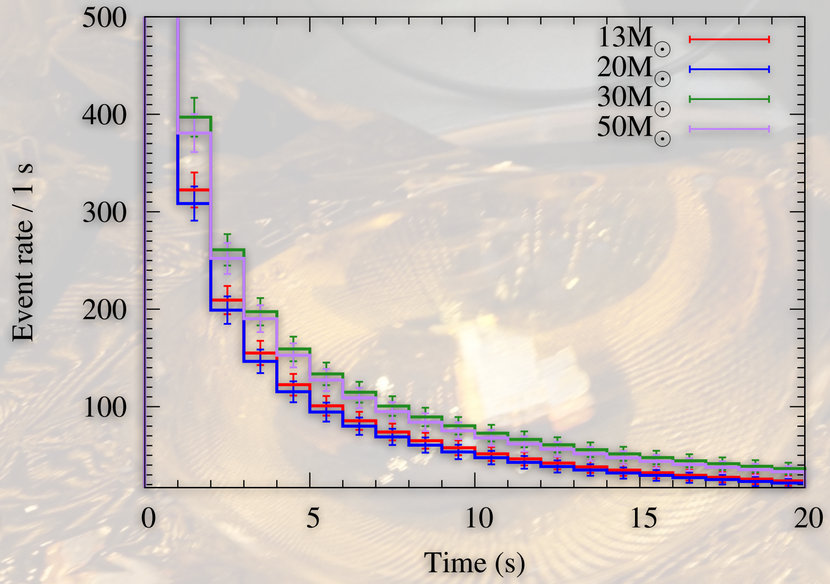
[Suwa, Sumiyoshi, Nakazato, Takahira, Koshio, Mori, Wendell, ApJ, **881**, 139 (2019)]

step 1

NUMERICAL SIMULATIONS

- Cooling curves of PNS
- Detailed physics included
- Discrete grid of data set
- Computationally expensive





* **Event rate evolution is calculated beyond 100 s**
  - with neutrino luminosity and energy spectrum
  - with full volume of SK's inner tank (32.5 kton)
  - assuming an SN at 10 kpc
  - detector response for inverse beta decay ($\bar{\nu}_e + p \rightarrow e^+ + n$)
* **Event rate is not related to progenitor mass, but PNS mass**

Analytic solutions

step 2

$f(x)$

ANALYTIC SOLUTIONS

- Analytic cooling curves

[Suwa, Harada, Nakazato, Sumiyoshi, PTEP, 2021, 0130E01 (2021)]

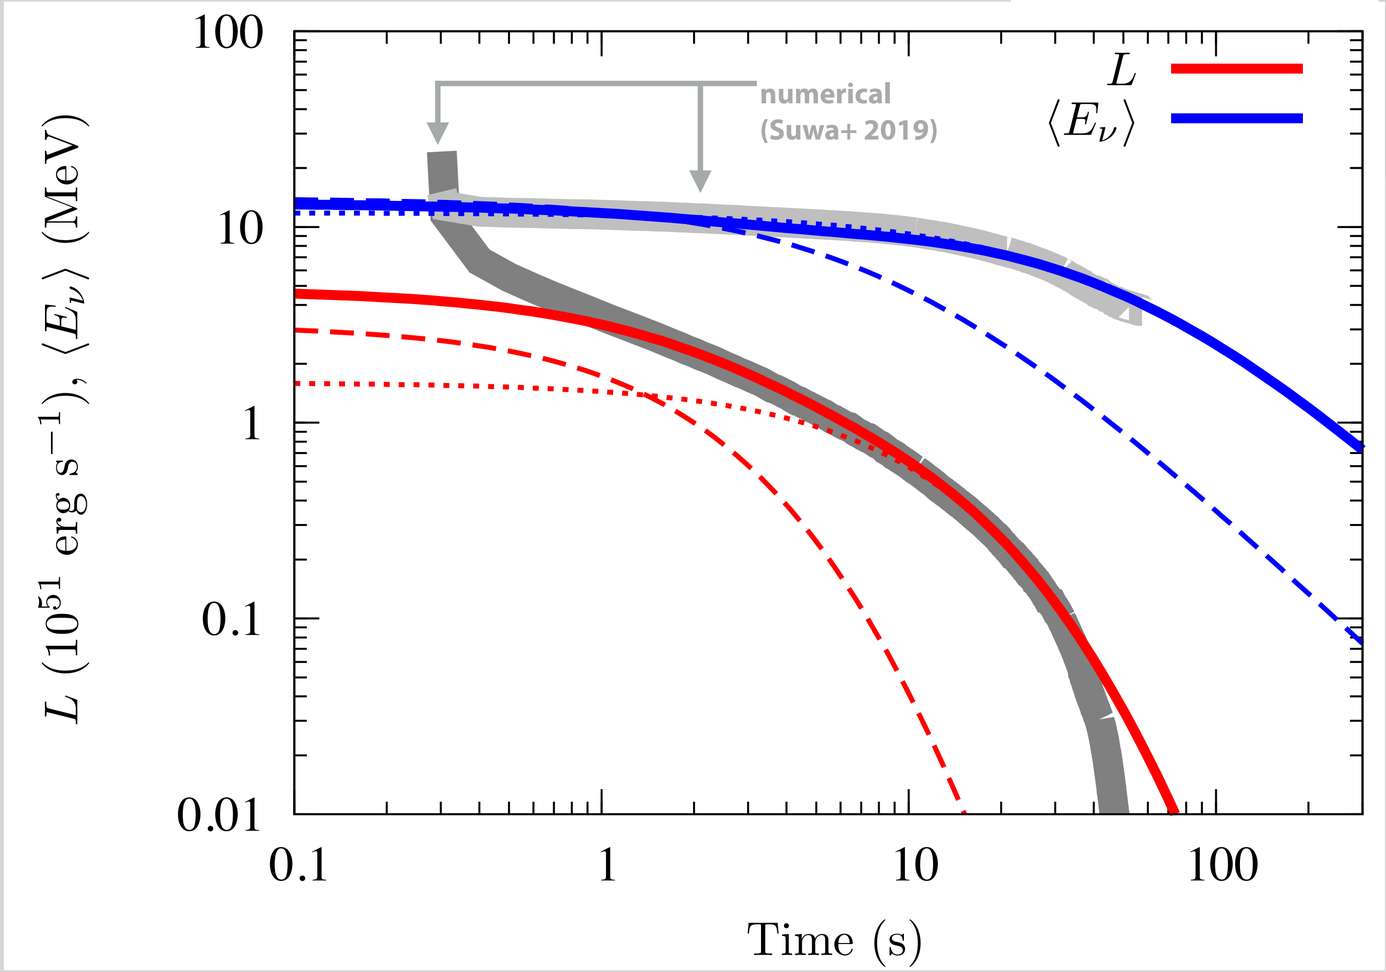
* **Solve neutrino transport eq. analytically**
  - **Neutrino luminosity**

$$L = 3.3\times10^{51}\,\mathrm{erg\,s^{-1}}\left(\frac{M_{\rm PNS}}{1.4M_\odot}\right)^{6}\left(\frac{R_{\rm PNS}}{10\,\mathrm{km}}\right)^{-6}\left(\frac{g\beta}{3}\right)^{4}\left(\frac{t+t_0}{100\,\mathrm{s}}\right)^{-6}$$

  - **Neutrino average energy**

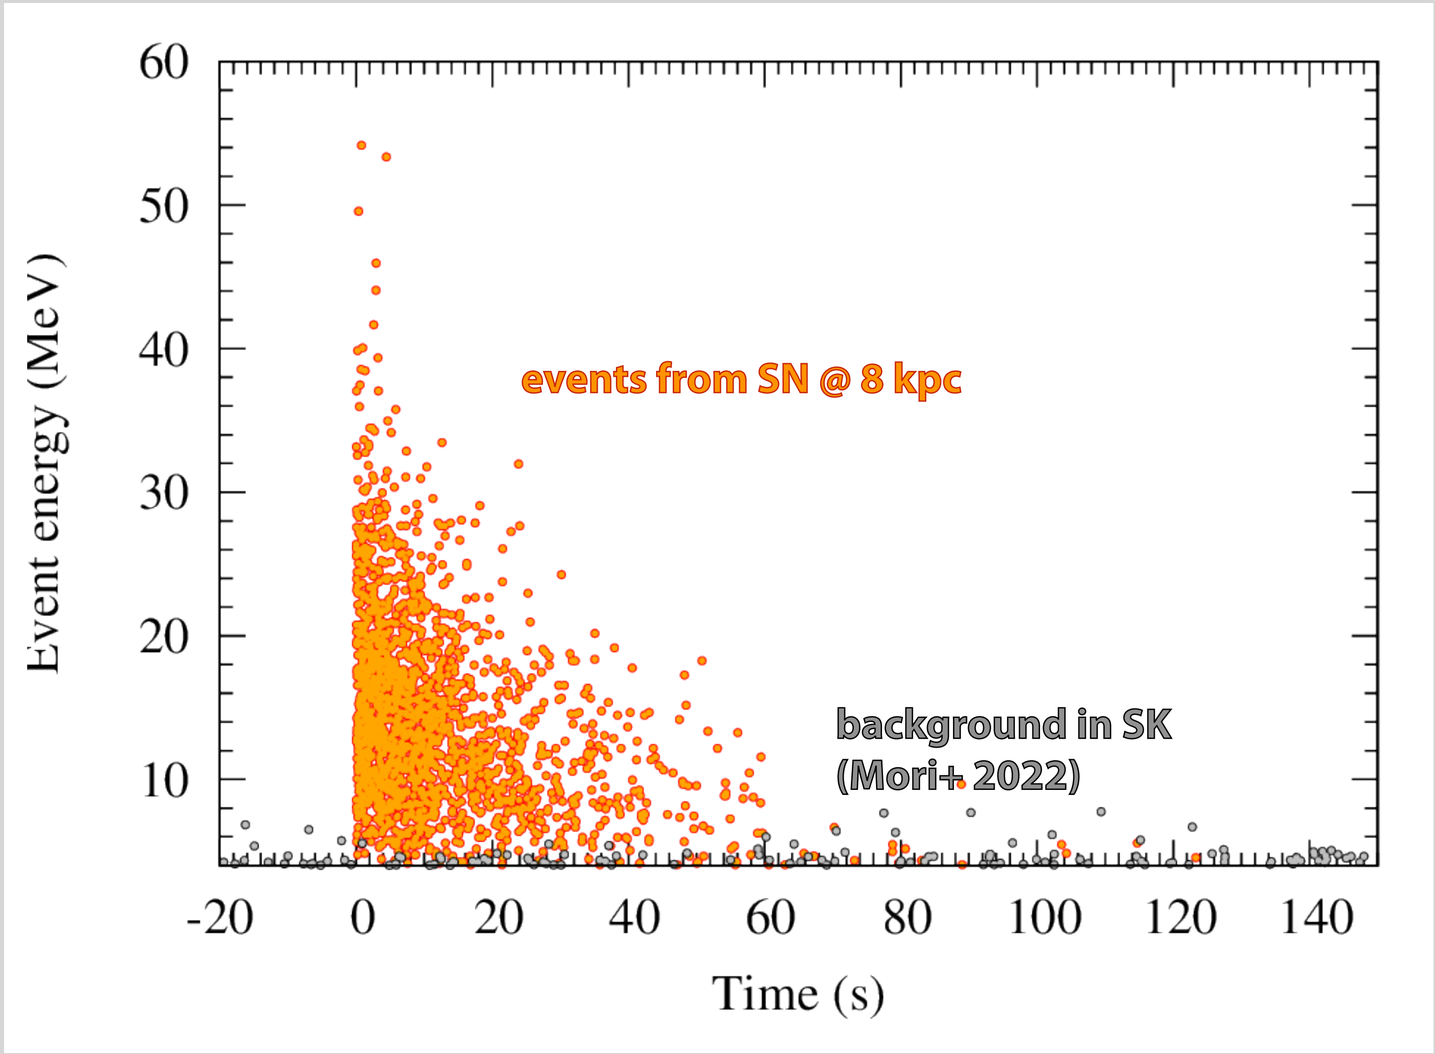
$$\langle E_\nu\rangle = 16\,\mathrm{MeV}\left(\frac{M_{\rm PNS}}{1.4M_\odot}\right)^{3/2}\left(\frac{R_{\rm PNS}}{10\,\mathrm{km}}\right)^{-2}\left(\frac{g\beta}{3}\right)\left(\frac{t+t_0}{100\,\mathrm{s}}\right)^{-3/2}$$

  - **two-component model**
    - early cooling phase (β=3)
    - late cooling phase (β=*O*(10))



Mock sampling

[Suwa, Harada, Harada, Koshio, Mori, Nakanishi, Nakazato, Sumiyoshi, Wendell, ApJ, 934, 15 (2022)]



See also Mori-san's talk !

step 3

DATA ANALYSIS

- Mock sampling
- Analysis pipeline for real data
- Error estimate for future observations

Data fitting and measuring physical quantities

[Suwa, Harada, Harada, Koshio, Mori, Nakanishi, Nakazato, Sumiyoshi, Wendell, ApJ, 934, 15 (2022);
Harada, Suwa, Harada, Koshio, Mori, Nakanishi, Nakazato, Sumiyoshi, Wendell, ApJ, 954, 52 (2023)]

step 3

DATA ANALYSIS

- Mock sampling
- Analysis pipeline for real data
- Error estimate for future observations

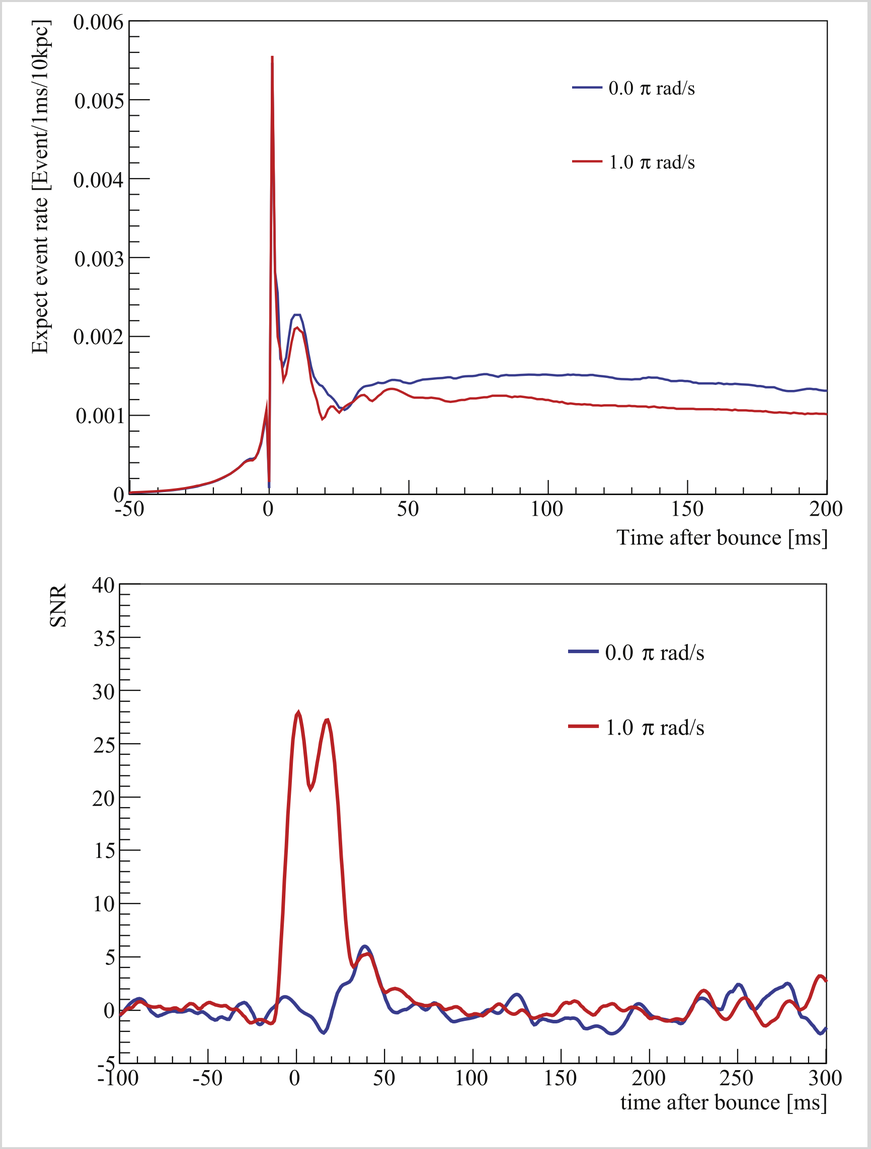
Combining neutrinos and GWs

[Yokozawa, Asano, Kayano, Suwa, Kanda, Koshio, Vagins, ApJ, 811, 86 (2015)]



* **Neutrinos**
  - luminosity and average energy don't depend on rotation of the iron core
    → expected event rate evolution are same
* **Gravitational waves**
  - onset time strongly depends on rotation (existence of bounce signal)
* **Onset time of ν and GW tells rotation**
  - $\tau_\nu > \tau_{\rm GW}$ → rotating
  - $\tau_\nu < \tau_{\rm GW}$ → non-rotating
* **Timing accuracy is essential, detectors at the same place (Kamioka) is perfect**

Summary

- **Supernovae are optimal targets of multi-messenger observations**
- **Neutrinos are robust**
  - promising signal
  - late cooling phase is critical for parameter estimate
- **Photons are needed to confirm**
  - counter part search in huge sky is a key
  - distance information from neutrino may be helpful
- **Gravitational waves are physics probe (smoking gun!)**
  - highly model dependent, difficult to predict
  - even non-detection constrains physics, but time window from neutrinos are crucial

- **Be prepared for the next nearby SN !**
