

RECENT TOPICS ON VERY HIGH ENERGY GAMMA-RAY ASTRONOMY

Masaki Mori

*Institute for Cosmic Ray Research,
University of Tokyo*

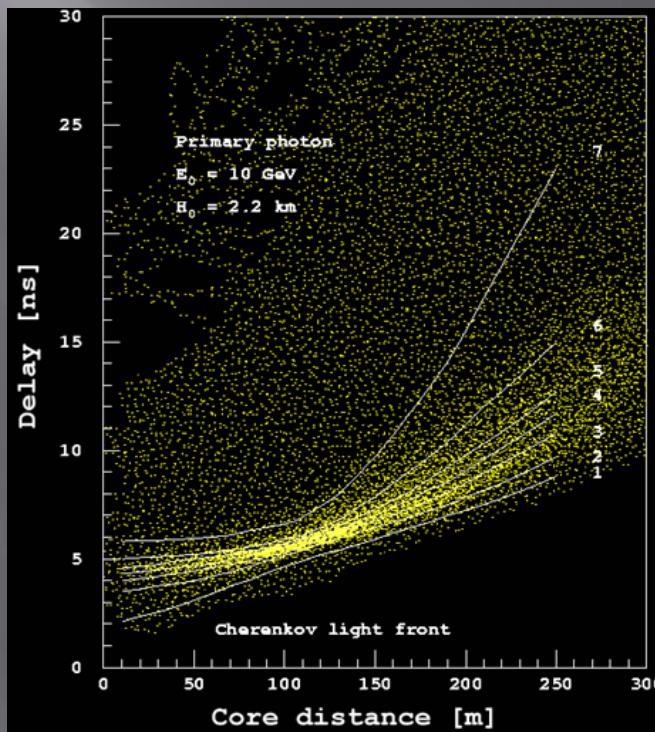

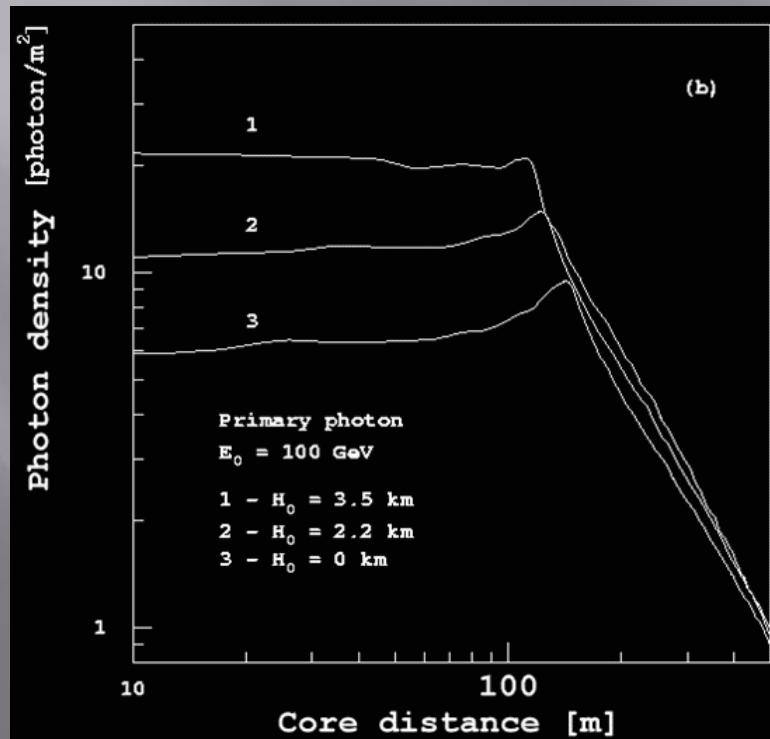

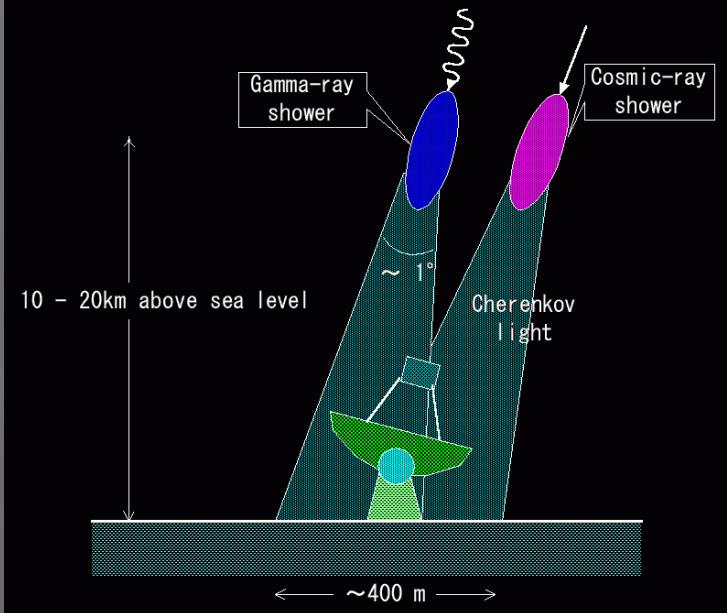

International Workshop on Advances in Cosmic Ray Science
March 17-19, 2008, Waseda University, Shinjuku, Tokyo, Japan

Detection of gamma-rays

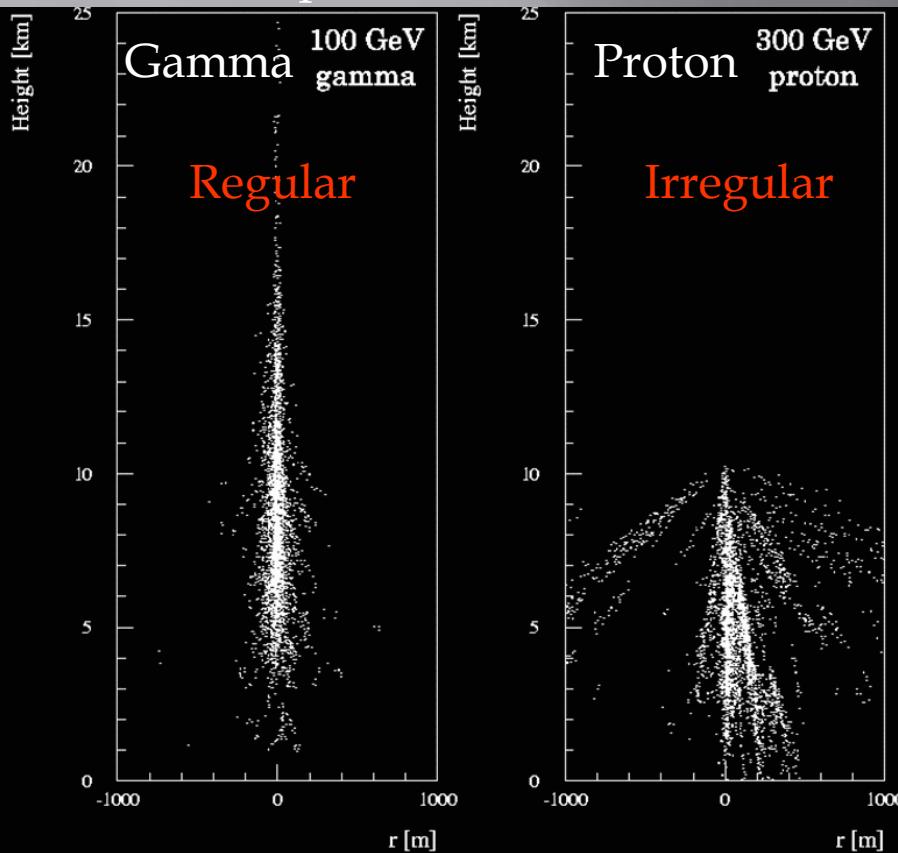

Atmospheric Cherenkov Telescope

Cherenkov light from gamma-ray showers
Lateral distribution & Timing distribution

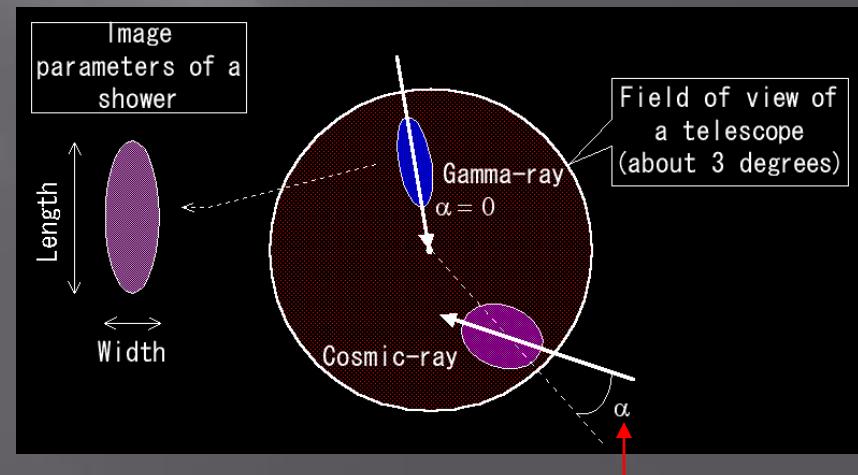

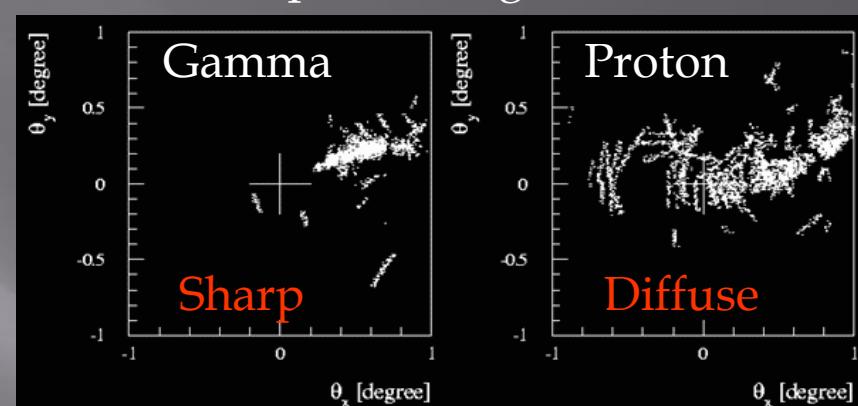

Imaging Atmospheric Cherenkov Telescope

Shower profile

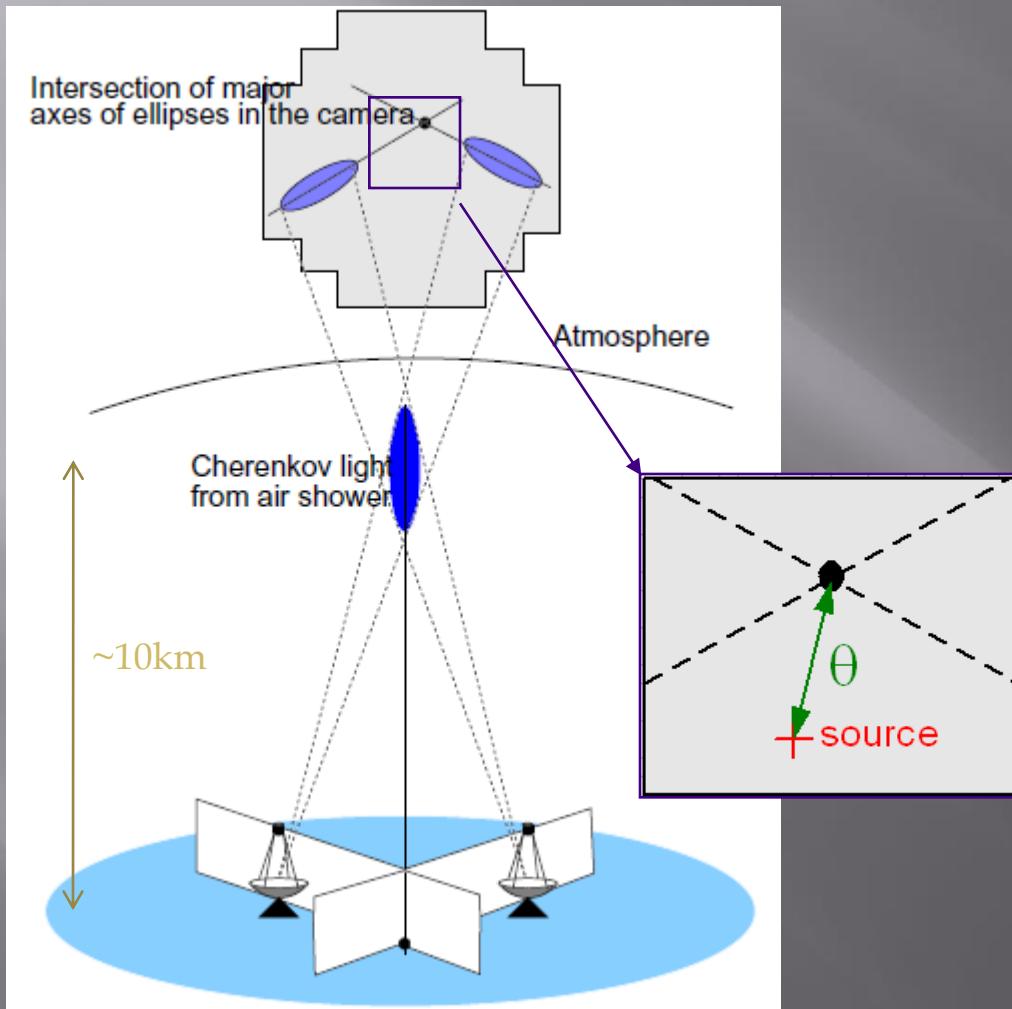

Focal plane image

→ Differentiation of gamma-rays
from charged cosmic rays

Stereoscopic observation of Cherenkov light

© S.Funk, 2005

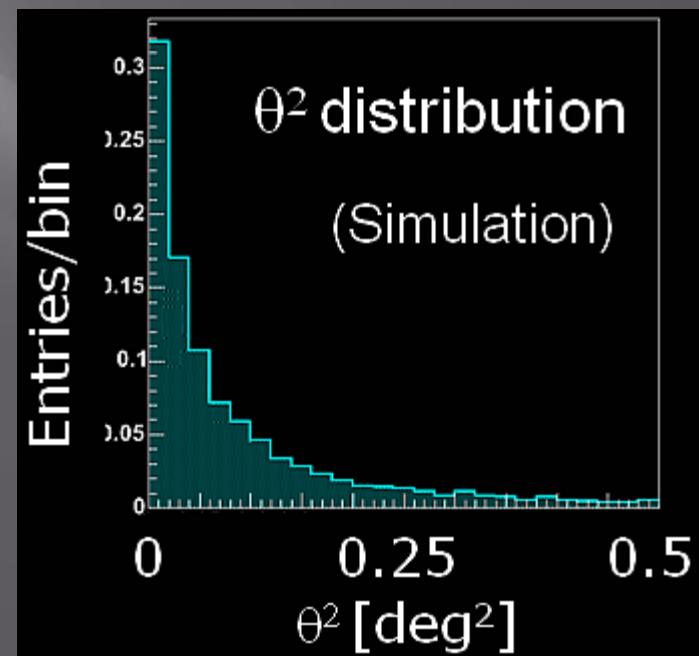

Angular resolution

$0.25\text{deg} \rightarrow 0.1\text{ deg}$

Energy resolution

$30\% \rightarrow 15\%$

Better S/N (no local muons)

Comparison of detection methods

Base	Satellite	Ground	Ground
Gamma-ray detection	Direct (pair creation)	Indirect (atmospheric Cherenkov)	Indirect (shower array)
Energy	< 30 GeV \rightarrow 100 GeV)	>100 GeV \rightarrow 50 GeV)	>3 TeV \rightarrow 1 TeV)
Pros	High S/N Large FOV	Large area Good $\Delta\theta$	24hr operation Large FOV
Cons	Small area High cost	Low S/N (CR bkgd.) <i>(but imaging overcomes this!)</i> Small FOV	Low S/N (CR bkgd.) Moderate $\Delta\theta$

Increase of TeV sources

Class	2003	2005	2007
PWN (Pulsar Wind Nebulae)	1	6	18
SNR (Subernova remnants)	2	3	7
Binary	0	2	4
Diffuse	0	2	2
AGN (Active Galactic Nuclei)	7	11	19
UnId (Unidentified sources)	2	6	21
Total	12	33	71!

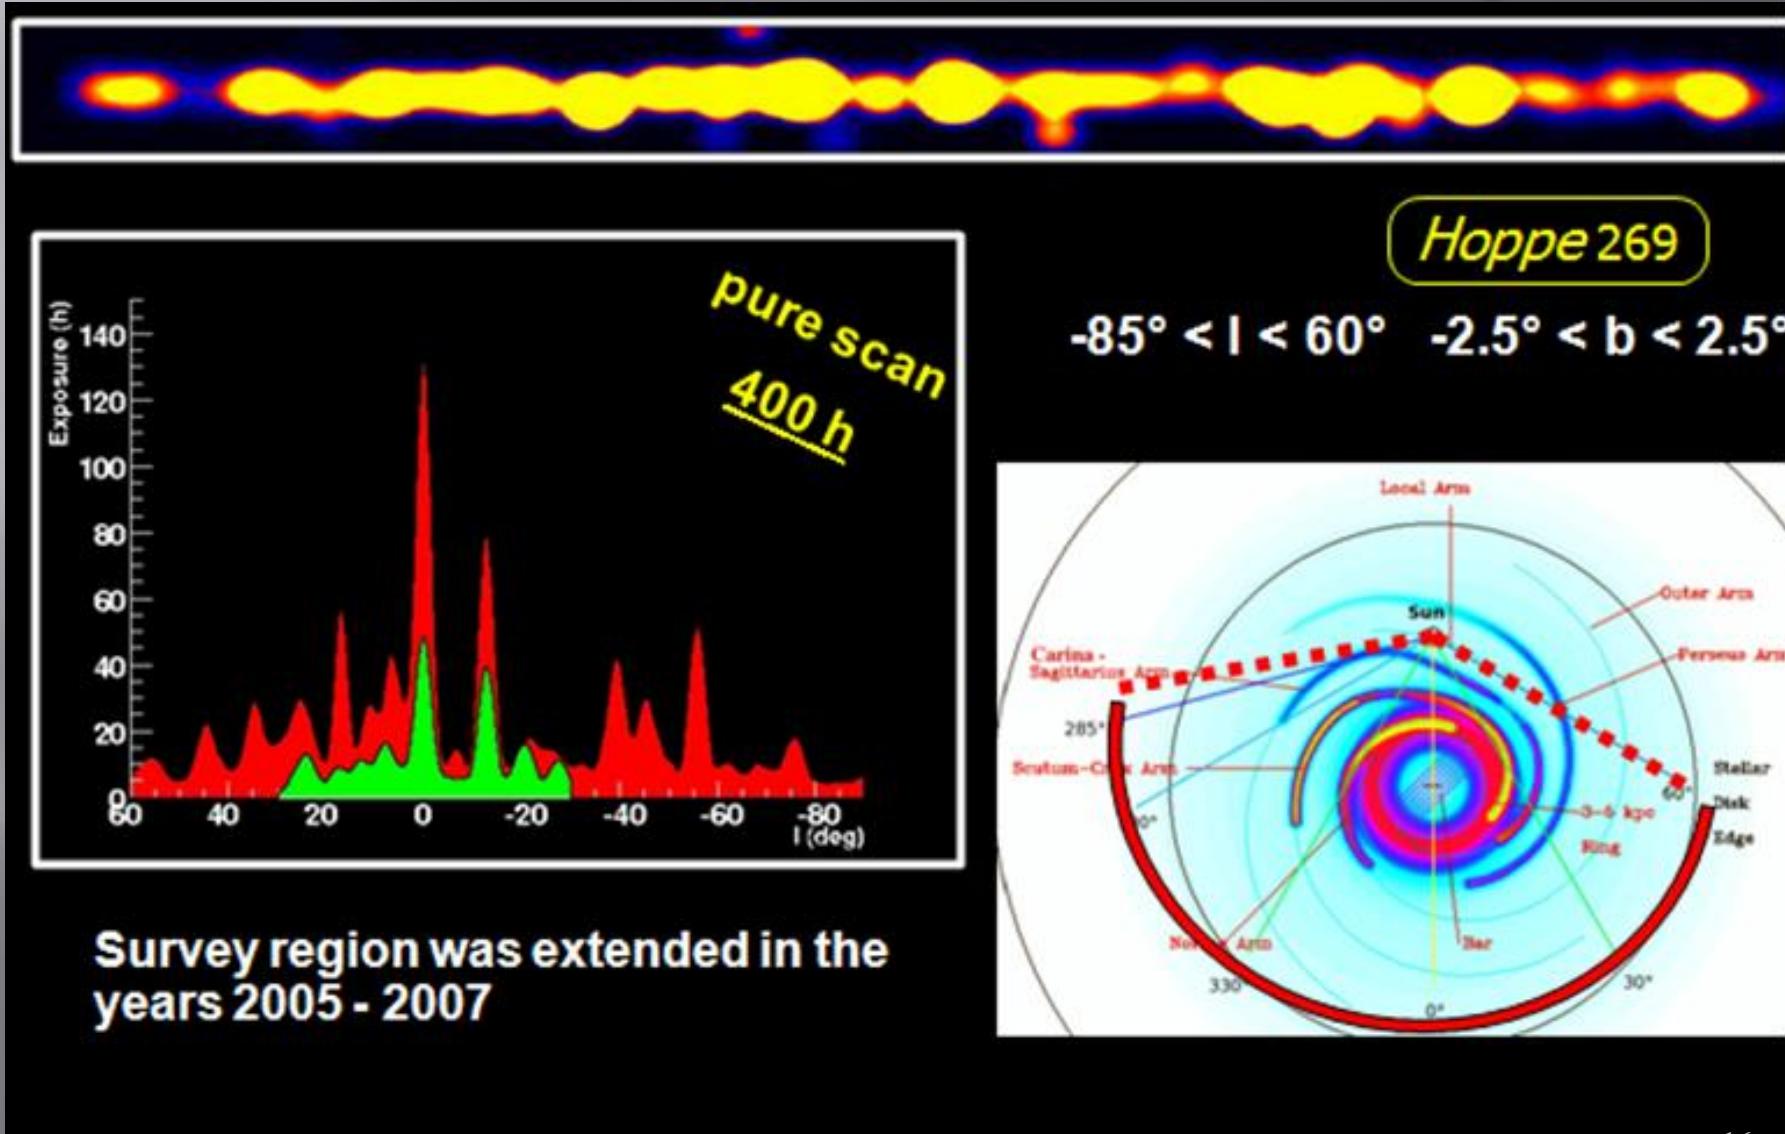

TeV sources classified

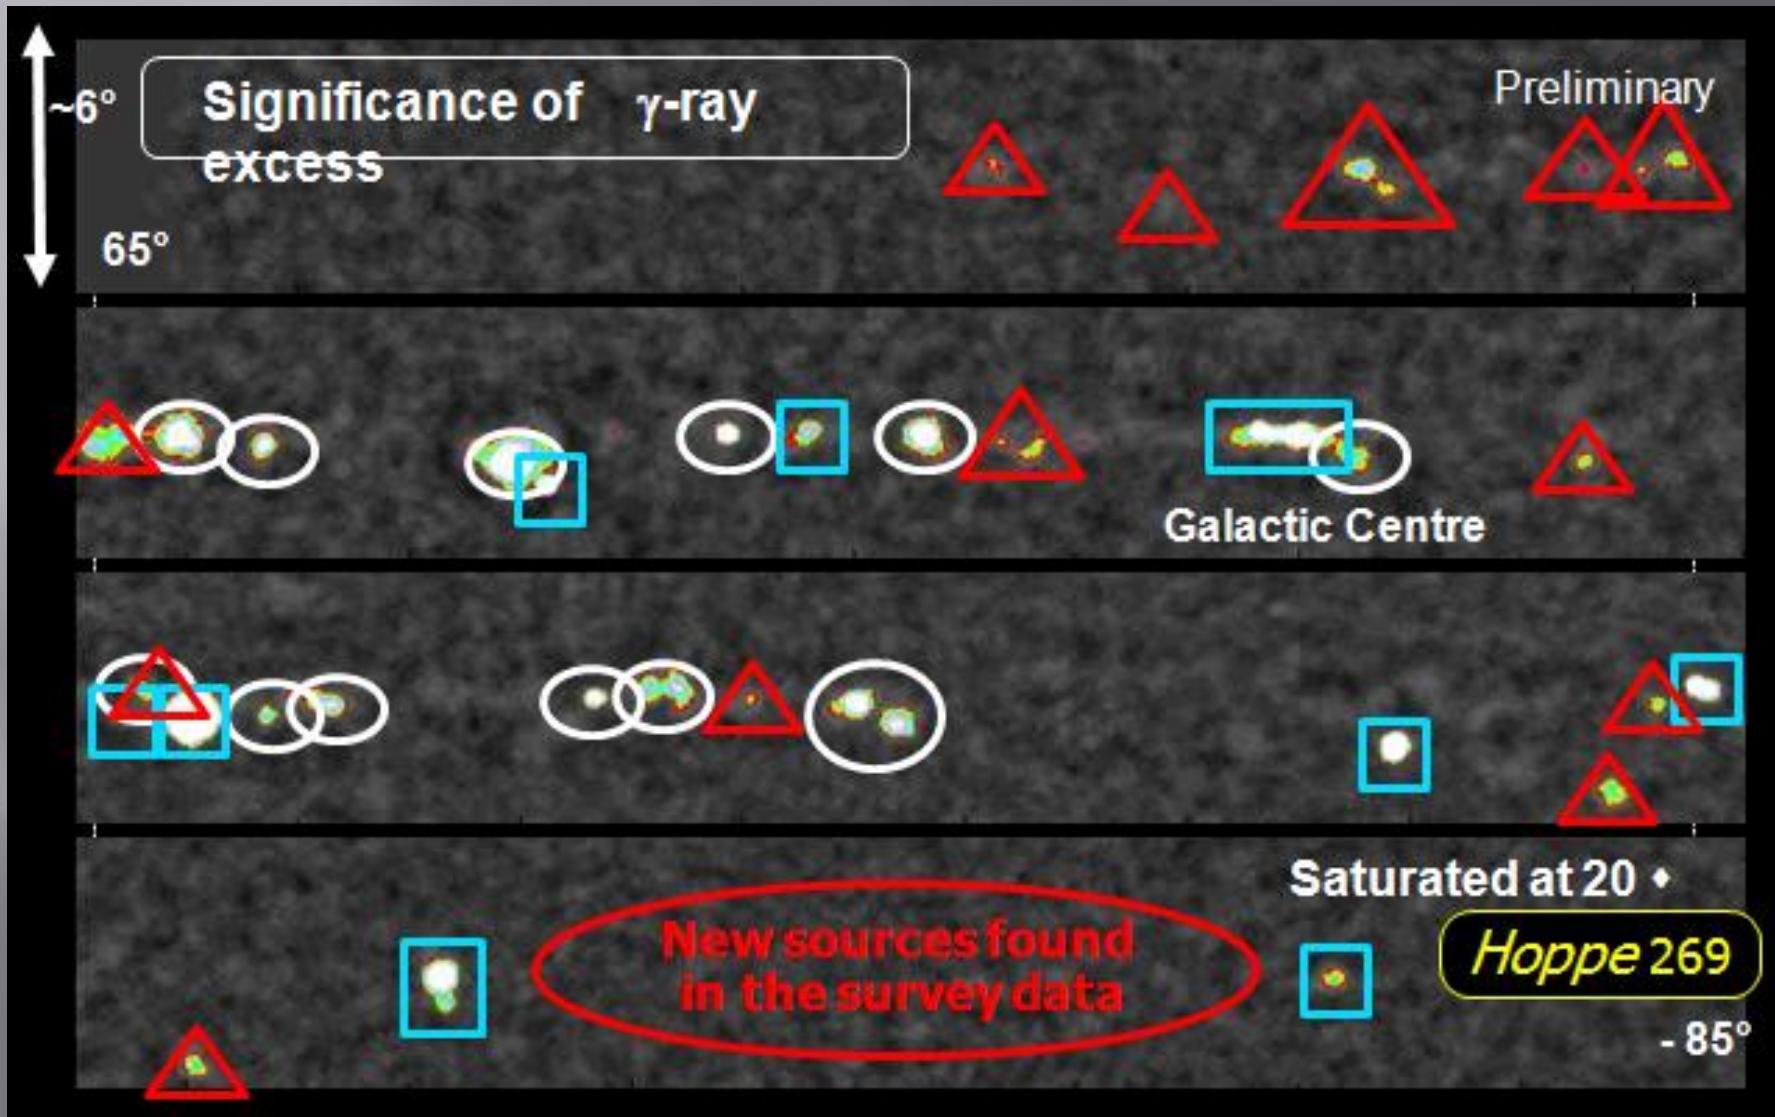

* Borders for SNR/PWN/UnID are vague...

H.E.S.S. Galactic survey

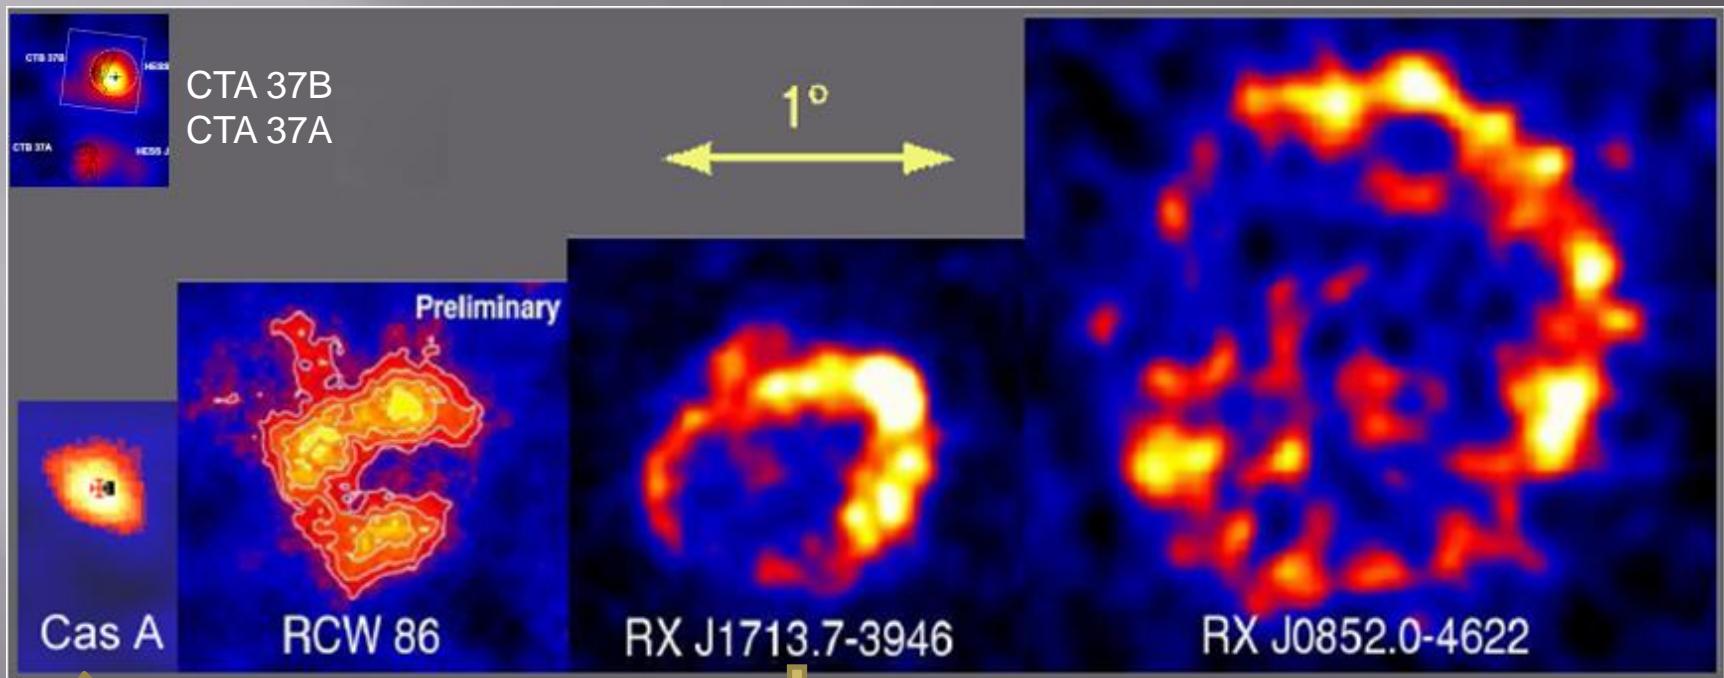

H.E.S.S. Galactic survey

Supernova remnants

- Long considered to be primary source for Galactic cosmic rays
- Pros:
 - Energetic enough (10% of SN explosion energy)
 - Size of object is large enough ($R \gg r_g$)
 - Many SNRs are bright radio sources:
at least electrons are accelerated!
- Cons:
 - Magnetic fields too low to go beyond 10^{14}eV
 - Additional problem: adiabatic losses

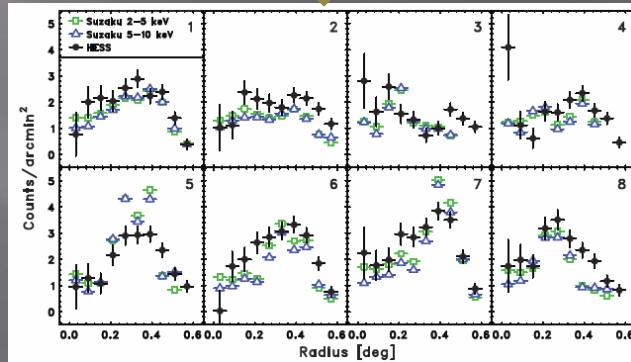

Shell SNRs seen at TeV

Comparable
to PSF (0.09°)

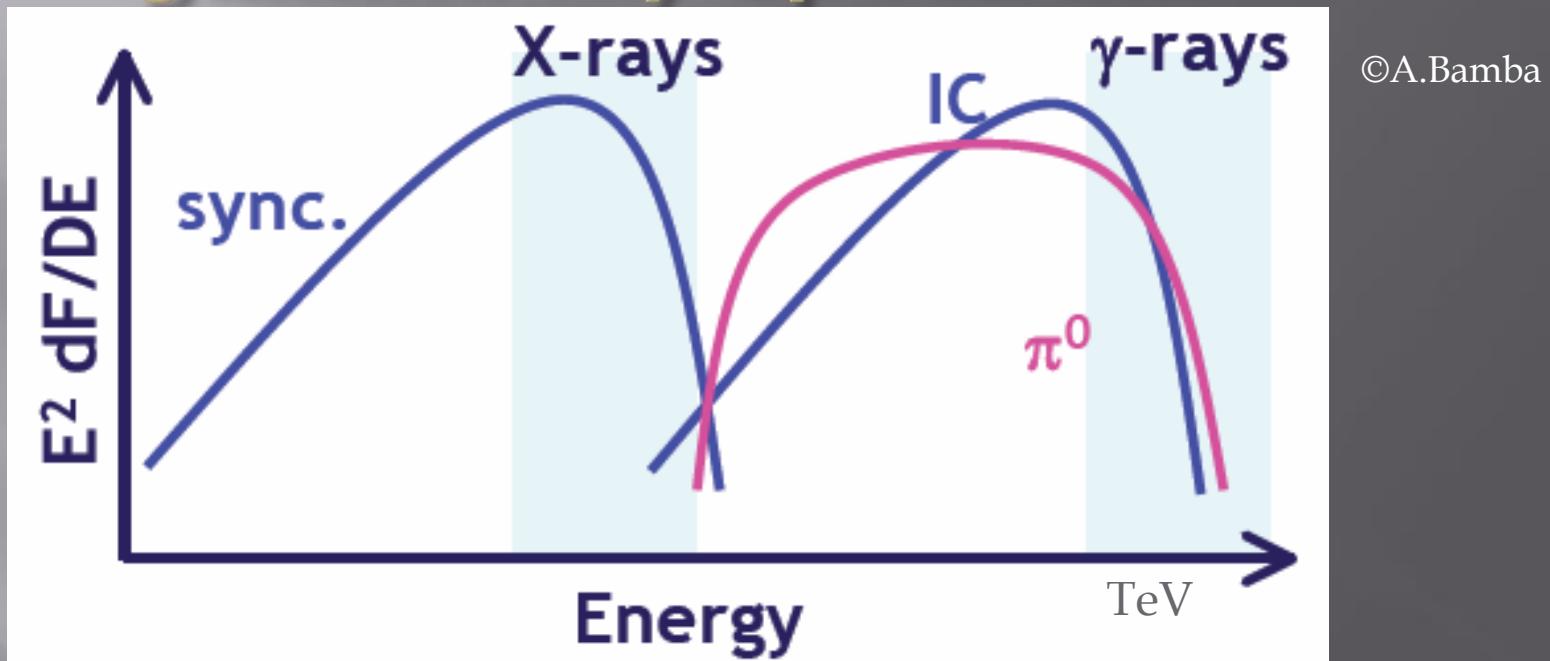

J. Albert et al., A&A 474,
934 (2007)

Good keV-TeV
Correlation!

RX J0842.0-4622

Proton model

NO definitive answer
for accelerated particles!

Identification of particles is not easy

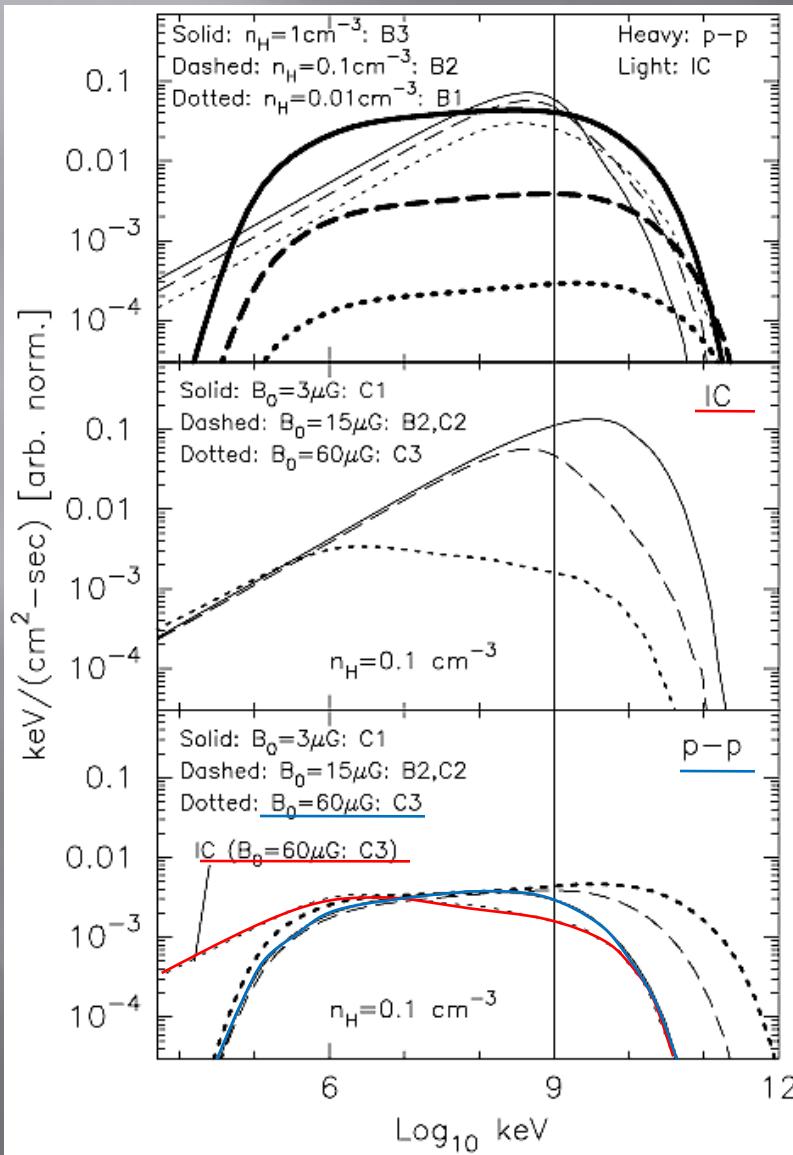

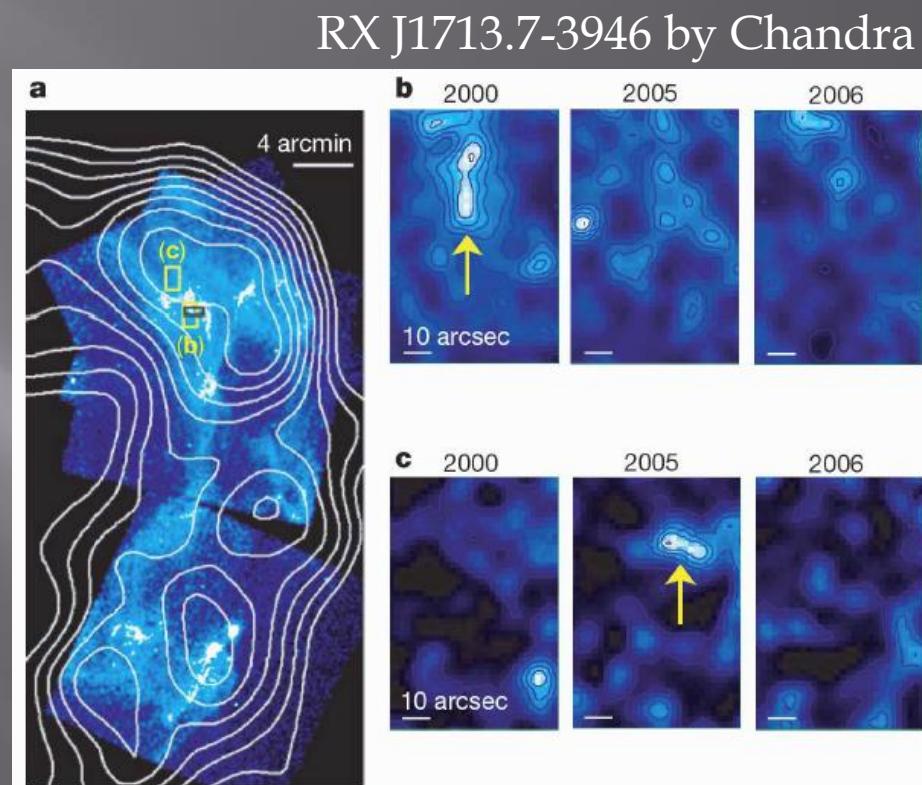

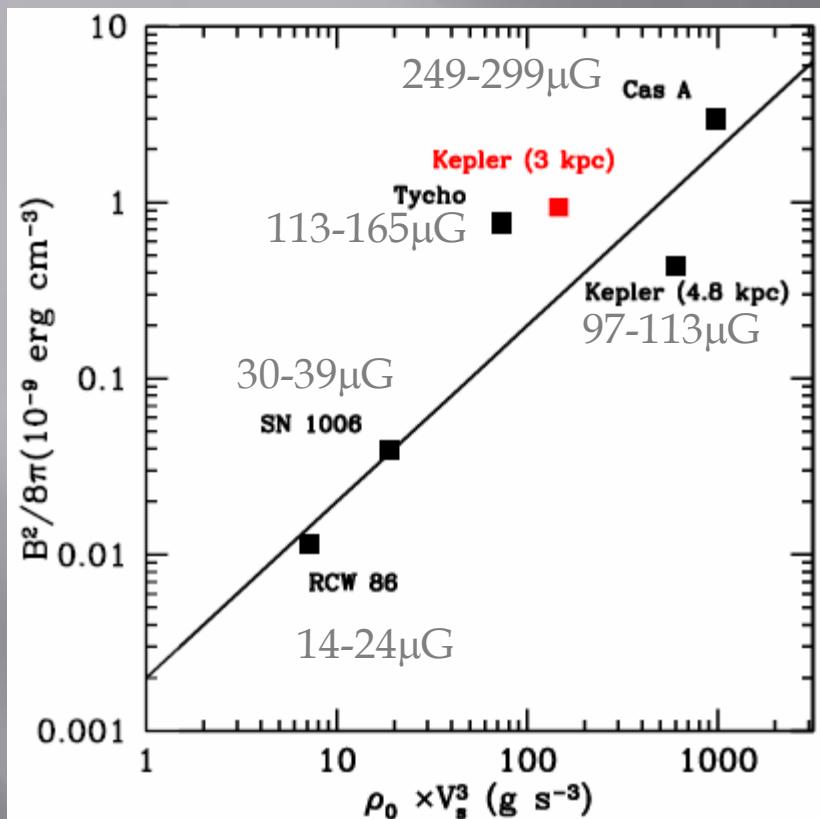

FIG. 12.—Pion-decay and IC emission for a range of n_{H} and B_0 . In the top panel, the heavy curves are pion decay, the light curves are IC, and $\epsilon_{\text{rel}} = 36\%$ and $B_0 = 15 \mu\text{G}$ in all cases. The strong dependence of pion decay on ambient density n_{H} is evident. The middle panel shows IC, and the bottom panel shows pion decay for $n_{\text{H}} = 0.1 \text{ cm}^{-3}$, with B_0 varying from $3 \mu\text{G}$ (solid curves) to $15 \mu\text{G}$ (dashed curves) to $60 \mu\text{G}$ (dotted curves). For comparison to the π^0 , we show in the bottom panel the IC emission for $B_0 = 60 \mu\text{G}$ (light dotted curve). The particle distributions producing the emission in the bottom two panels are those shown in the top panel of Fig. 11.

Difficult in the GeV-TeV
region if magnetic field is
strong!

Magnetic field in SNR

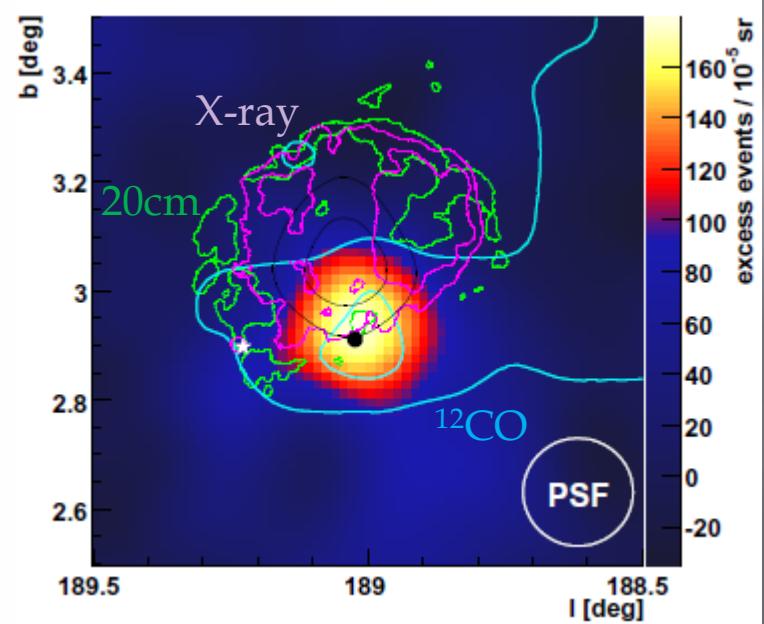

SNR	Dist kpc	V_s km s^{-1}	n_0 cm^{-3}	width "	B_{loss} μG	B_{diff} μG
Cas A	3.4	5200	3	0.5	249	299
Kepler	4.8	5300	0.35	1.5	97	113
Tycho	2.4	4500	0.3	2	113	165
SN1006	2.2	4300	0.1	20	30	39
RCW86	2.5	3500	0.1	45	24	14

Variation in ~1yr time scale
 → Need > 1mG ! (locally)
 → Protons produce TeV gamma-rays!?

Evidence of proton acceleration?

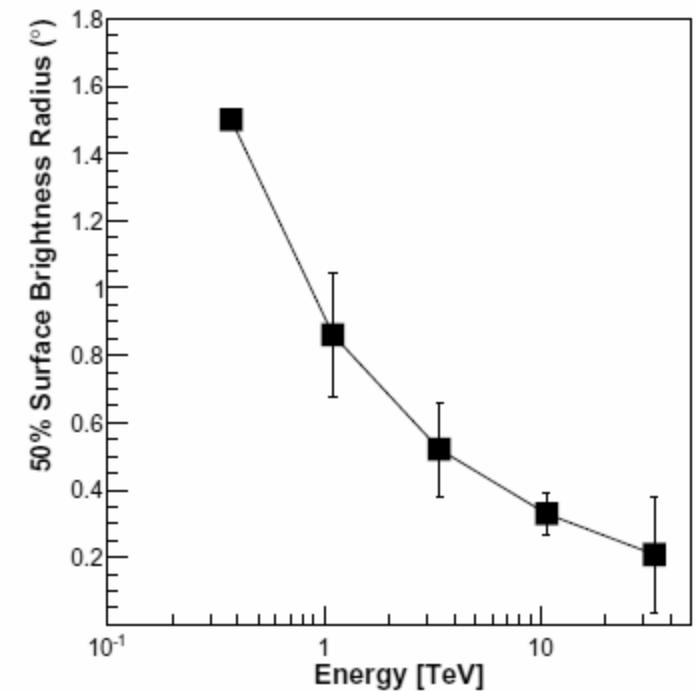

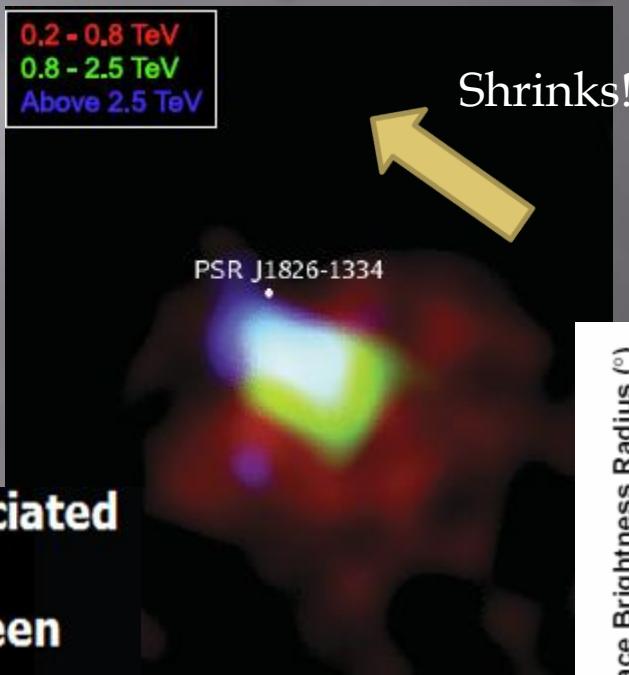

Pulsar nebulae

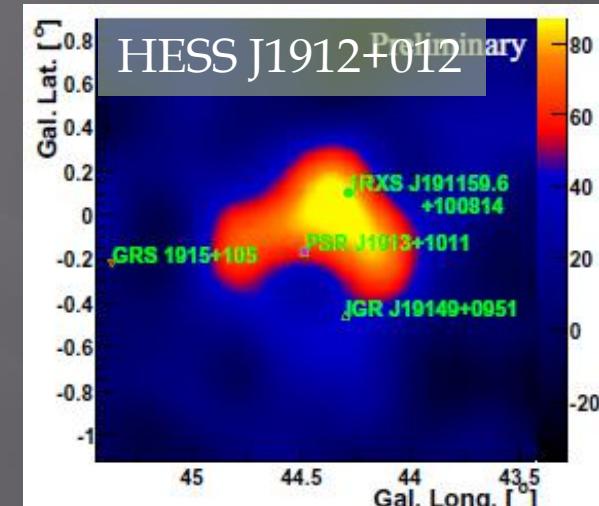

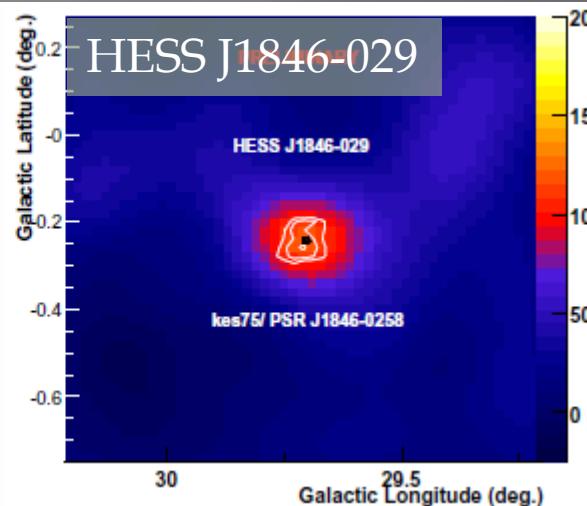

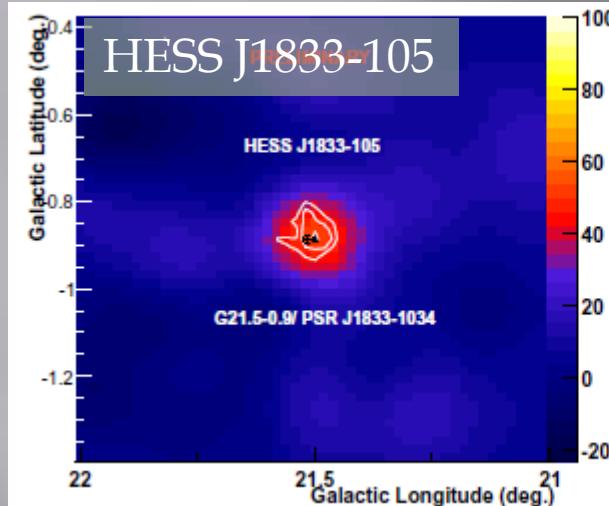

- Major group in Galactic TeV sources
 - 18/71 by Hinton (2007ICRC)
 - Associated with relatively young ($<10^5$ years) and large spin-down pulsars
- Extended $O(10\text{pc})$, displaced from pulsars
- Gamma-rays via inverse Compton by electrons?

Pulsar nebula: energy-dependent morphology

- HESS J1825-137 associated with energetic pulsar
- Spectral steepening seen away from the pulsar
- Very likely this is evidence for cooling of electrons in the Nebula
 - Seen in several X-ray PWN
- A first in gamma-ray astronomy!

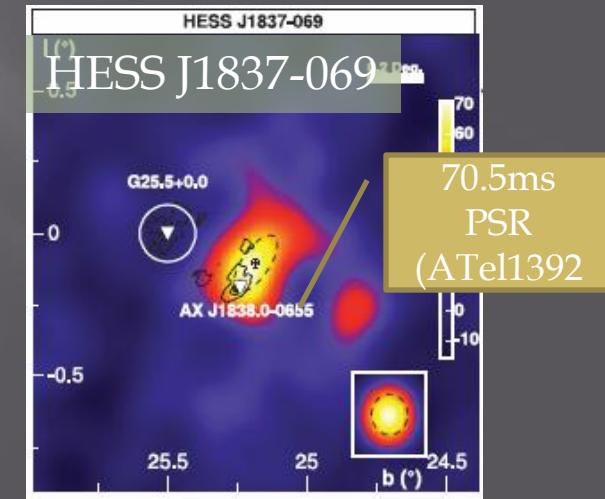

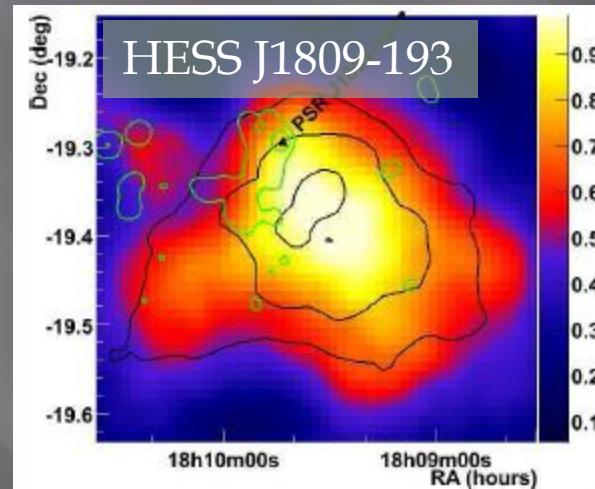

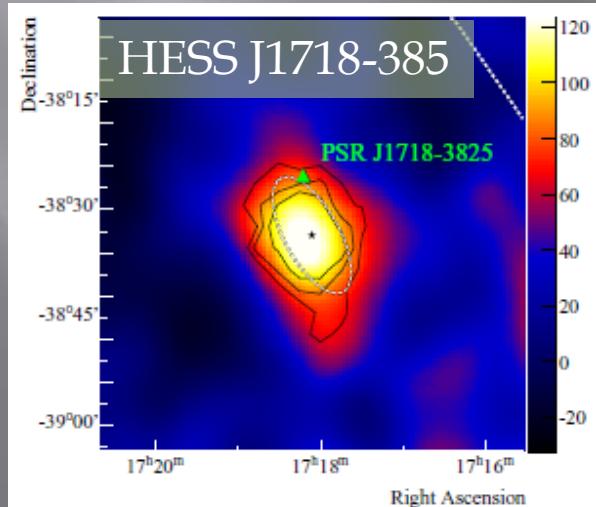

More pulsar nebulae...

Pulsar nebulae and spin-down luminosity

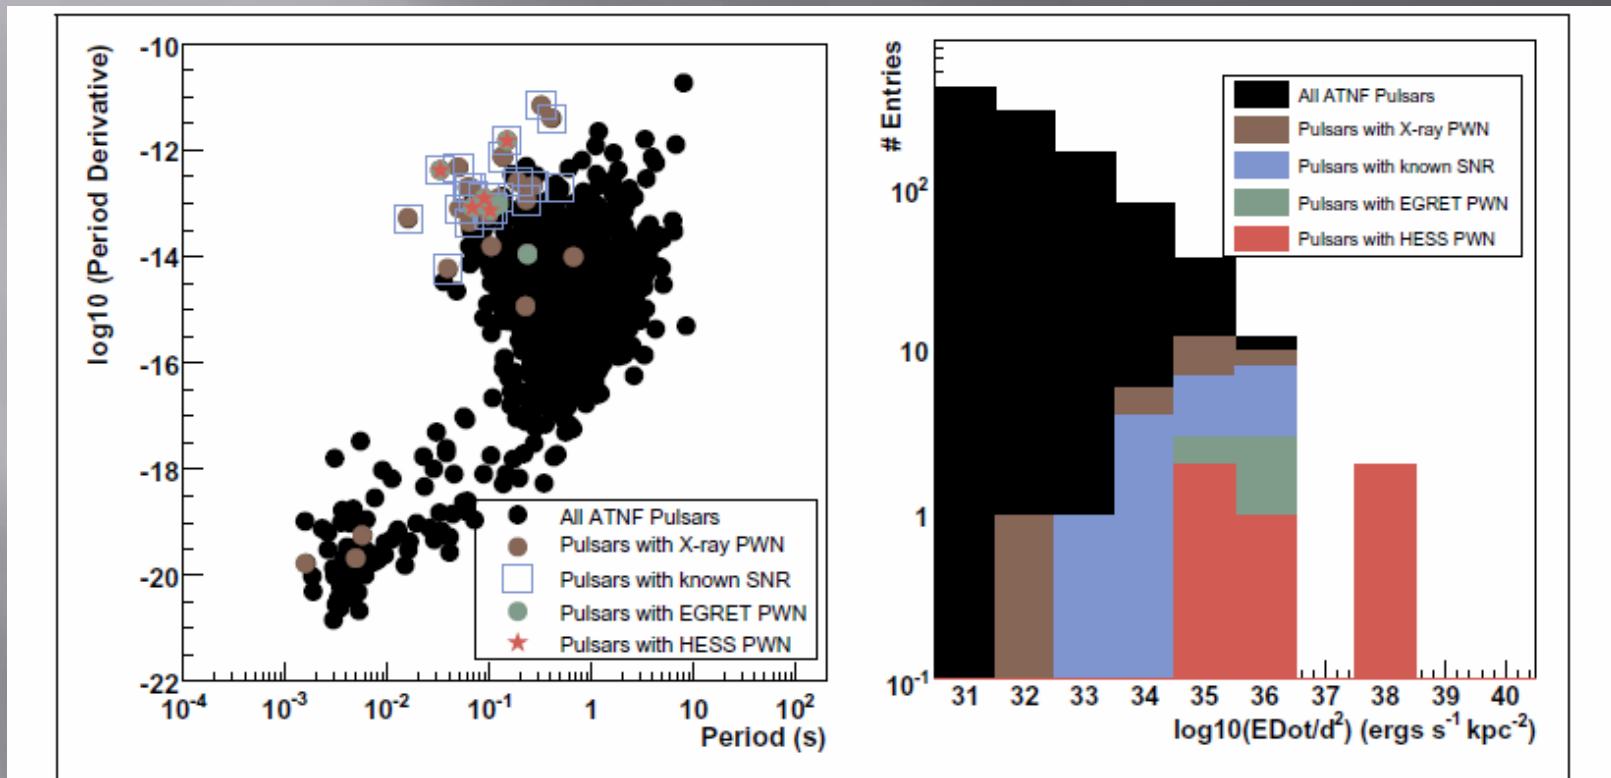

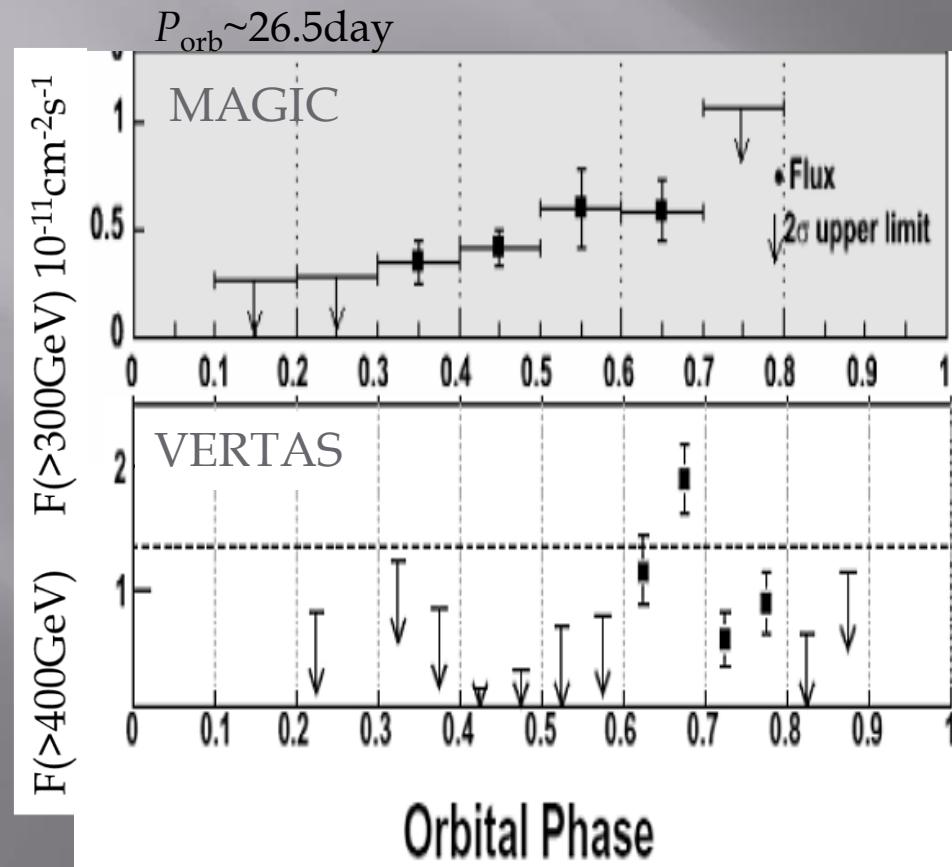

Figure 3: Top: $P - \dot{P}$ diagram for pulsars: all ATNF pulsars (black), with detected X-ray PWN (brown), with a known corresponding SNR (blue), potentially associated to an EGRET source (green), associated to a H.E.S.S. VHE PWN (red). Bottom: Energy output for the selections used at the top.

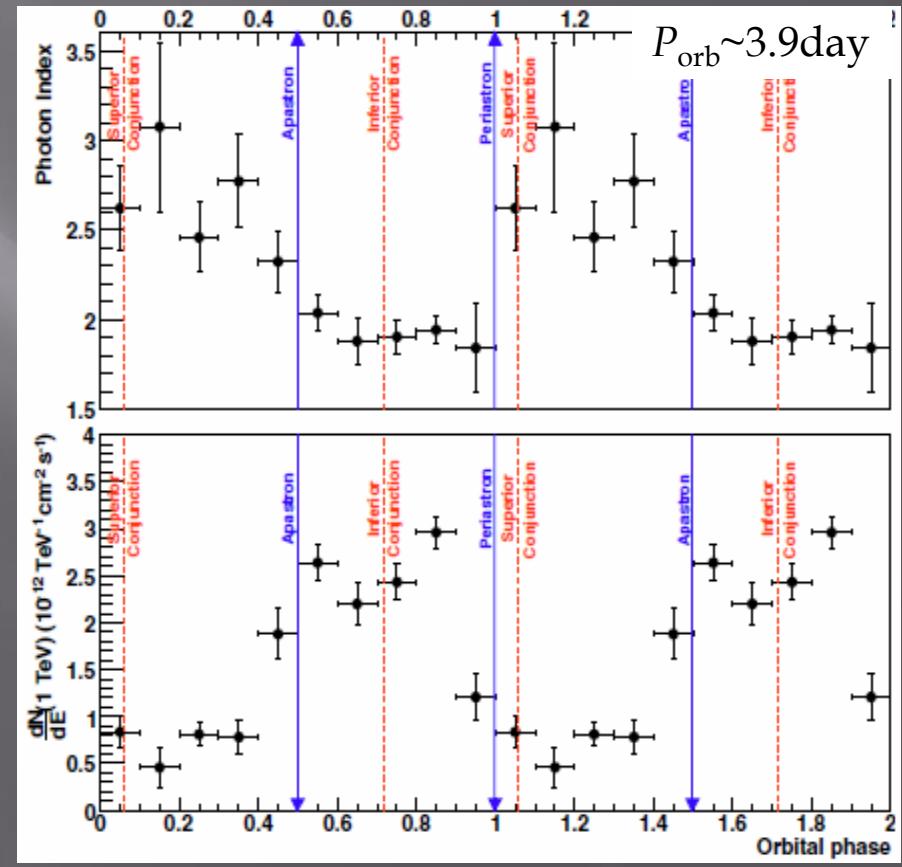

Gamma-ray binaries

LSI +61 303 (VERITAS/MAGIC)

J. Albert et al., Science 312, 1771 (2006)
 V.A. Acciari et al., arXiv:0802.2363

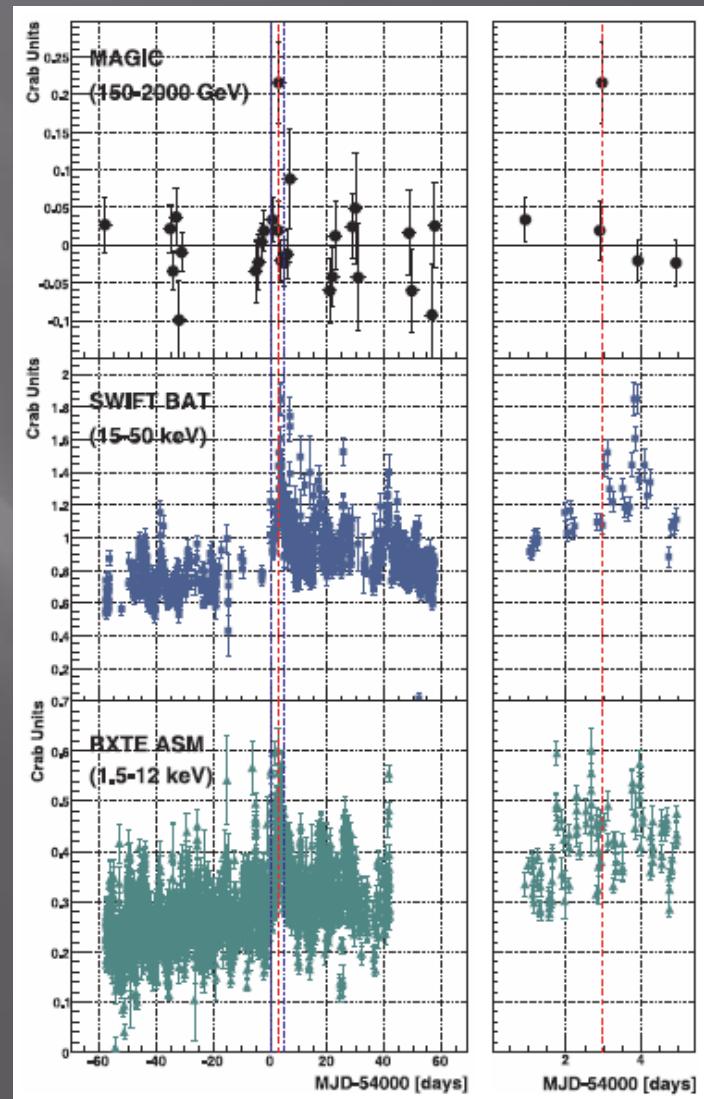

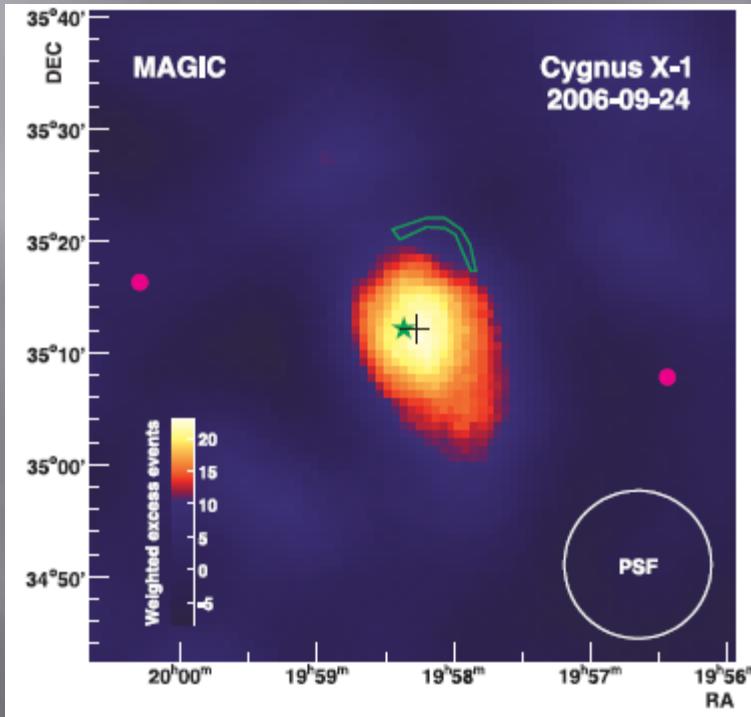

LS 5039 (H.E.S.S.)

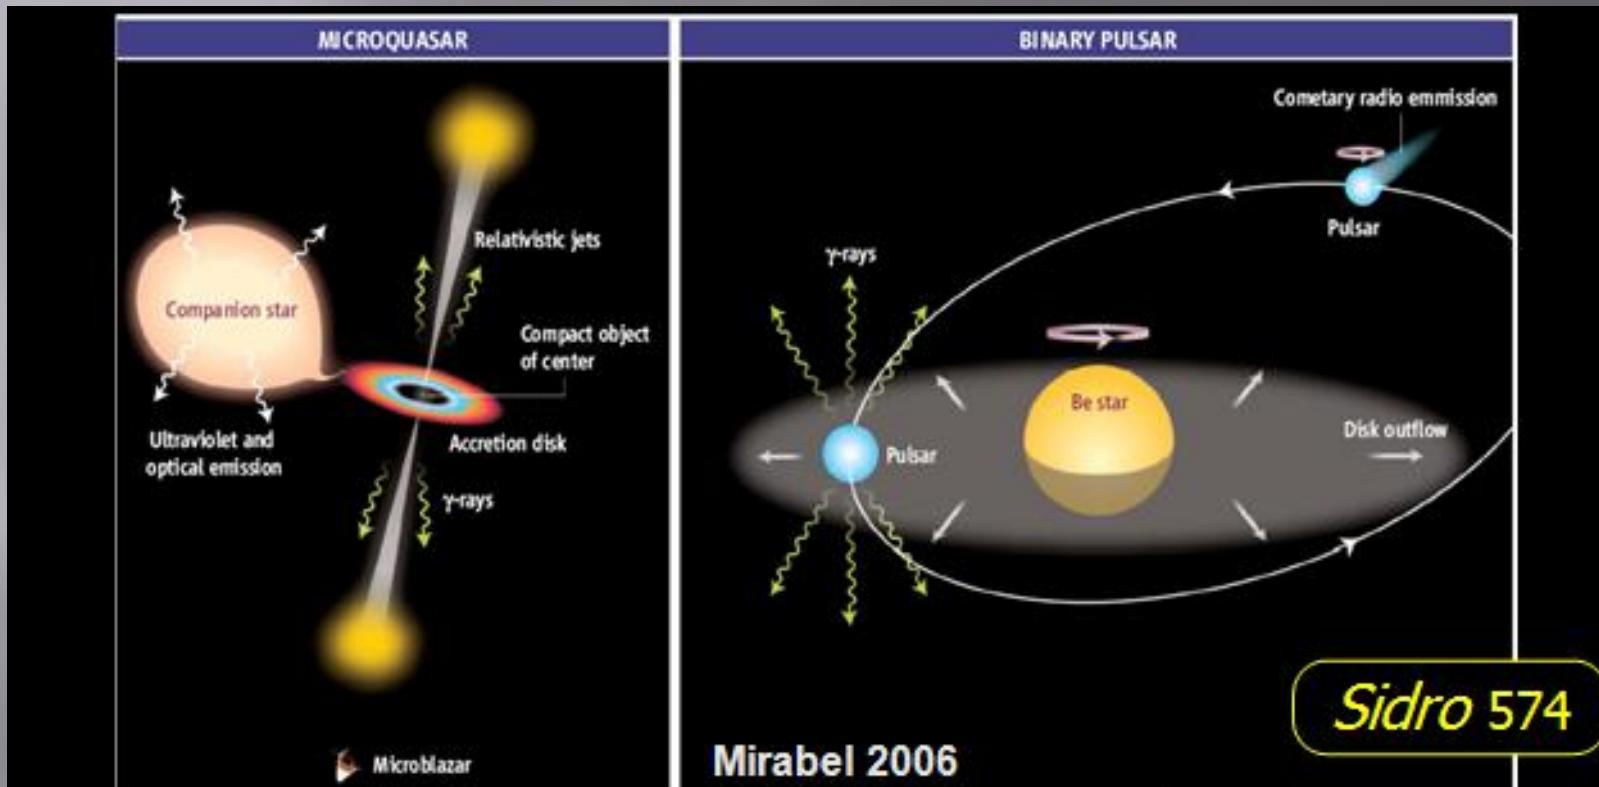

F. Aharonian et al., A&A 460 (2006) 743

Gamma-ray binary : Cyg X-1

- Black hole binary: $M_{\text{BH}} \sim 21M_{\odot}$, $M_{\star} \sim 30M_{\odot}$
- Relativistic jet $v > 0.6c$: “microquasar”
- MAGIC 40hr obs.
- 4.9σ seen in one 79 min. time slice
- Estimated significance: 4.1σ after correction for statistical trials

Emission from binaries

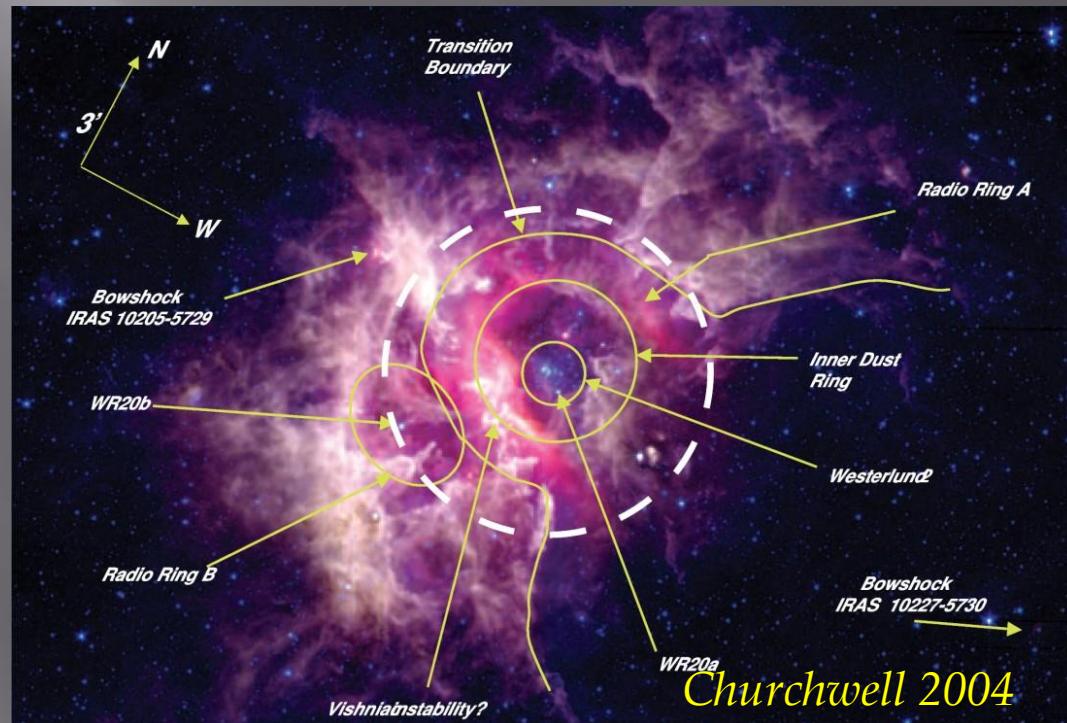

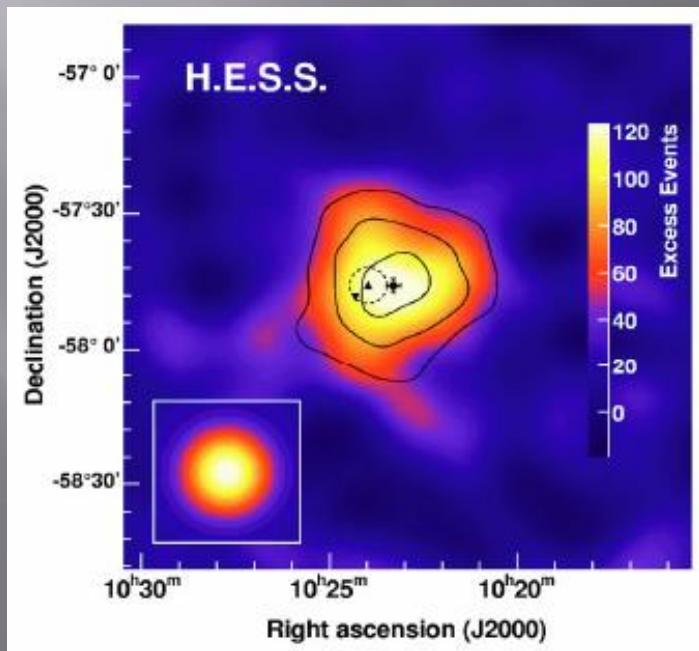

Microquasar: particles (electrons or hadrons) are accelerated in a jet
Bosch-Ramon et al. (2006), Romero et al. (2007)

γ -rays produced in the shock where the wind of the young pulsar and the wind of the Be star collide
Dubus (2006), Dhawan et al. (2006)

Stellar cluster Westerlund 2

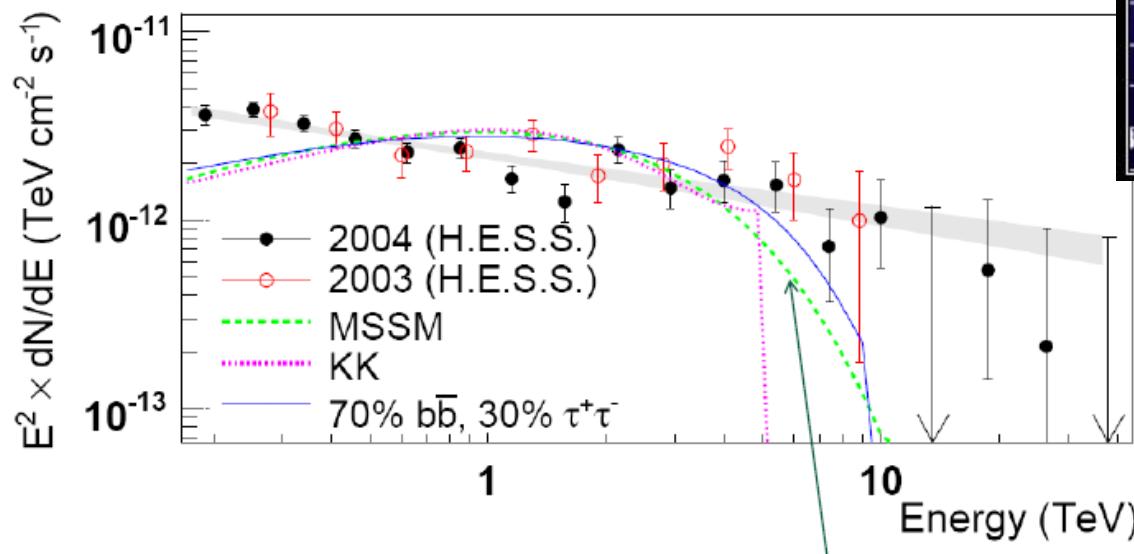

- Young open stellar cluster
 - Dozen O-stars
 - Two Wolf-Rayet stars ($\sim 80M_{\odot}$ each)!
- Extended gamma-ray emission covering (but offset from) Westerlund 2 by HESS
- Due to collective effects of stellar winds in the cluster?
- A new source class?

Galactic center ≈ Sgr A*

HESS data 2003-2004 towards galactic centre. (We await 2005-6 data eagerly...)

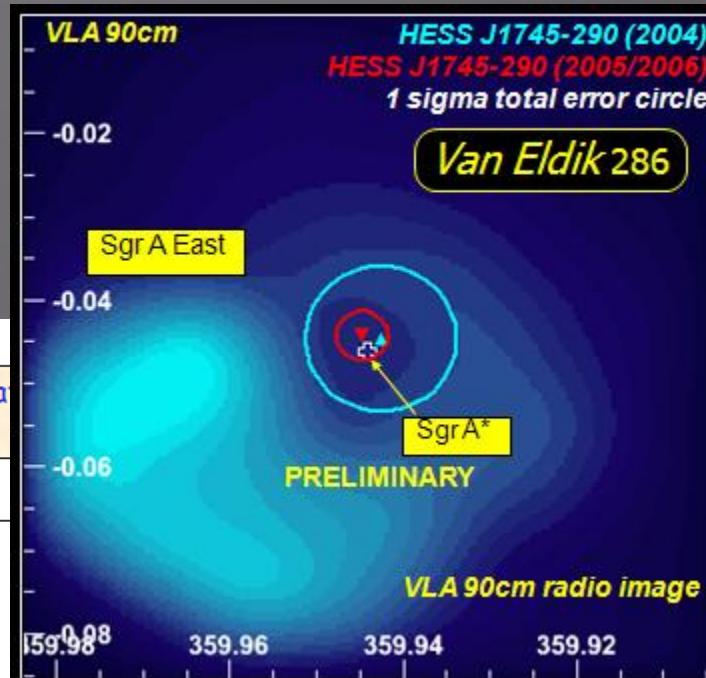

MAGIC (2006) data agree with HESS

Steady (time-independent) spectrum, pointlike within HESS angular resolution, could be Moore cusp instead of NFW?

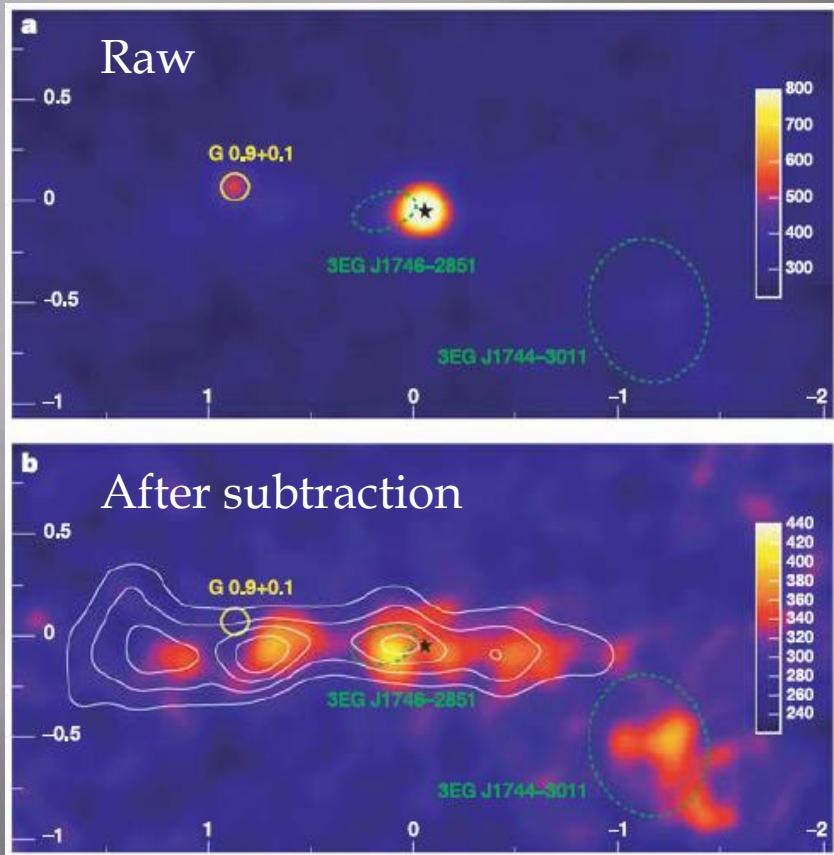

But: Probably too high energy (and wrong shape of spectrum) for WIMP annihilation explanation

Shape of these curves uncertain, depends on QED corrections and fragmentation of 5-10 TeV jets. LHC should give important input here.

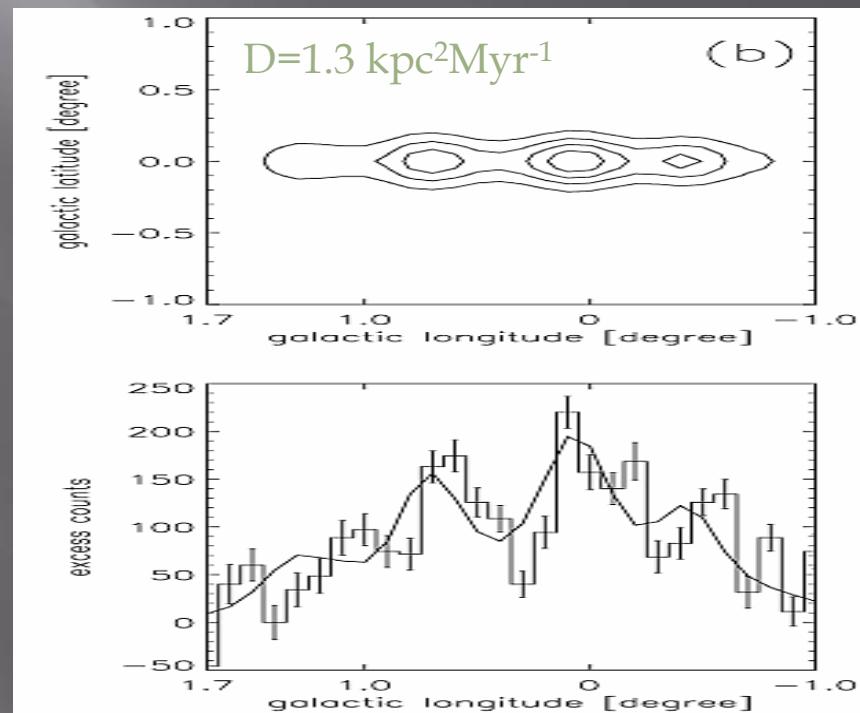

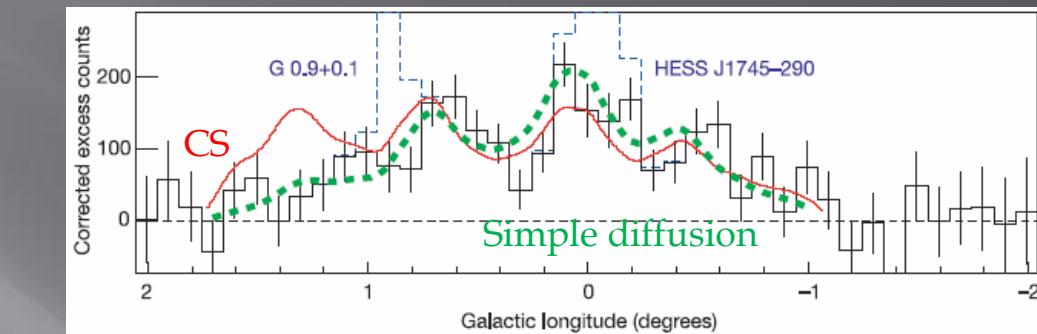

Energy spectrum is *not* consistent with dark matter annihilation signal!

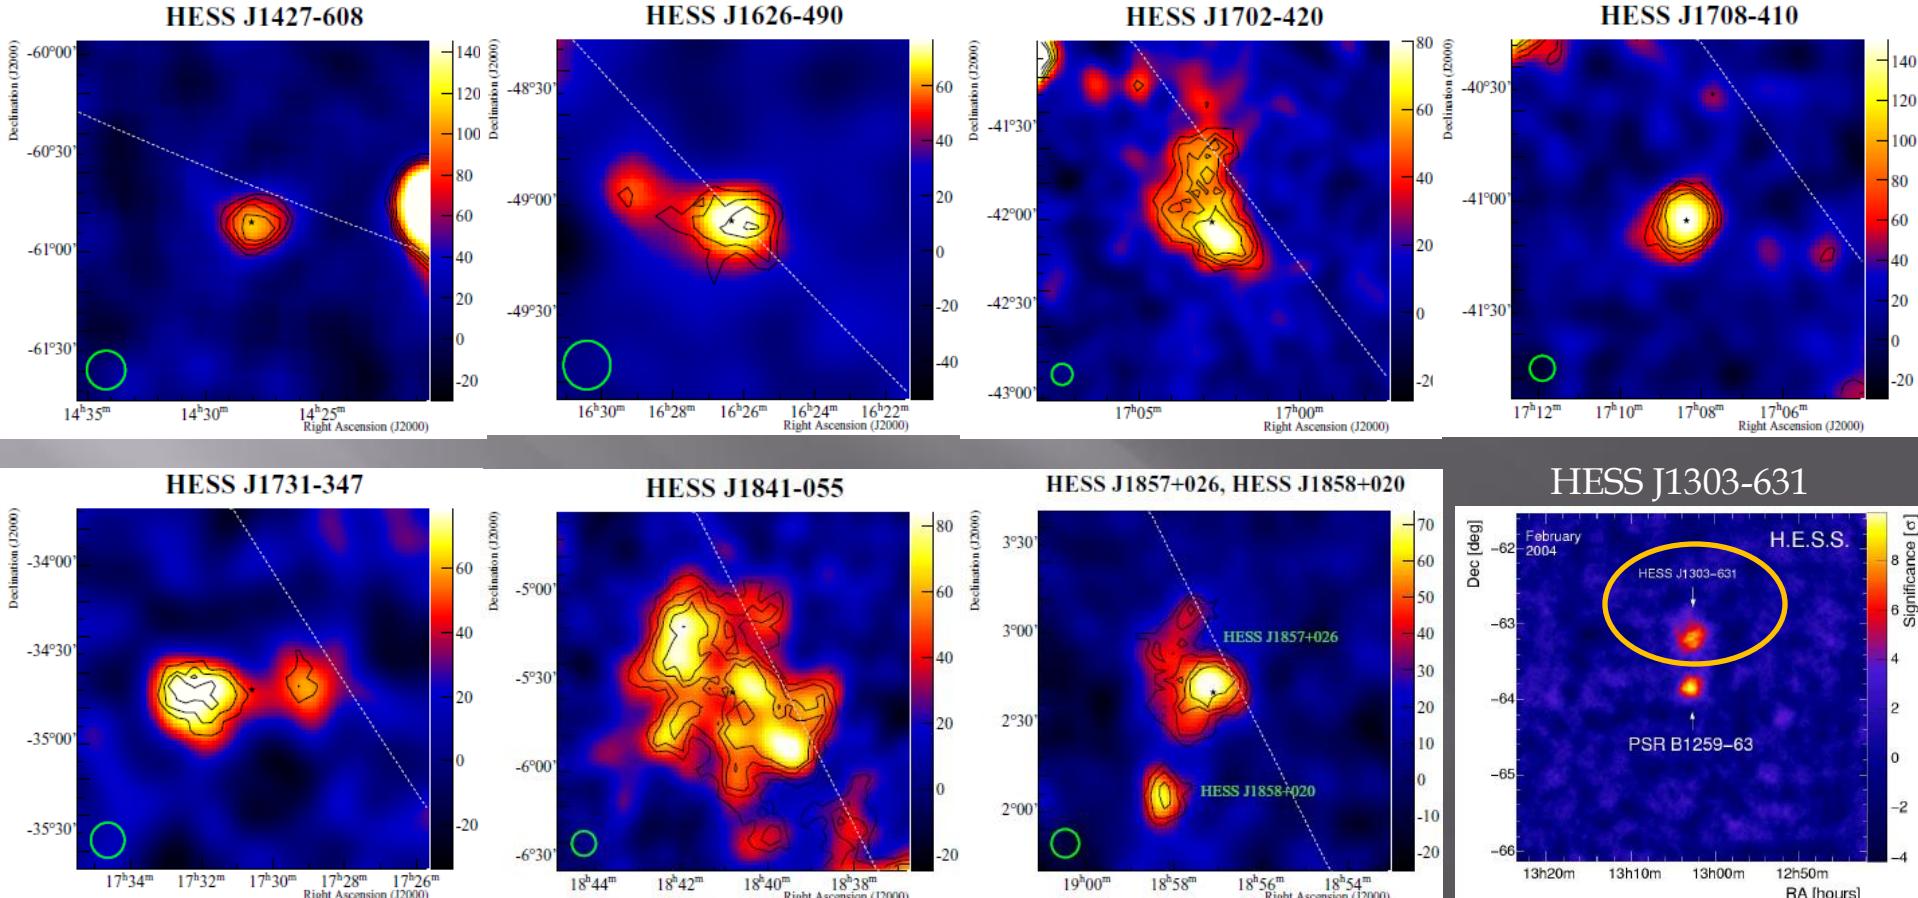

Galactic center ridge

Spectrum is harder than
CR spectrum!

Unidentified HESS sources

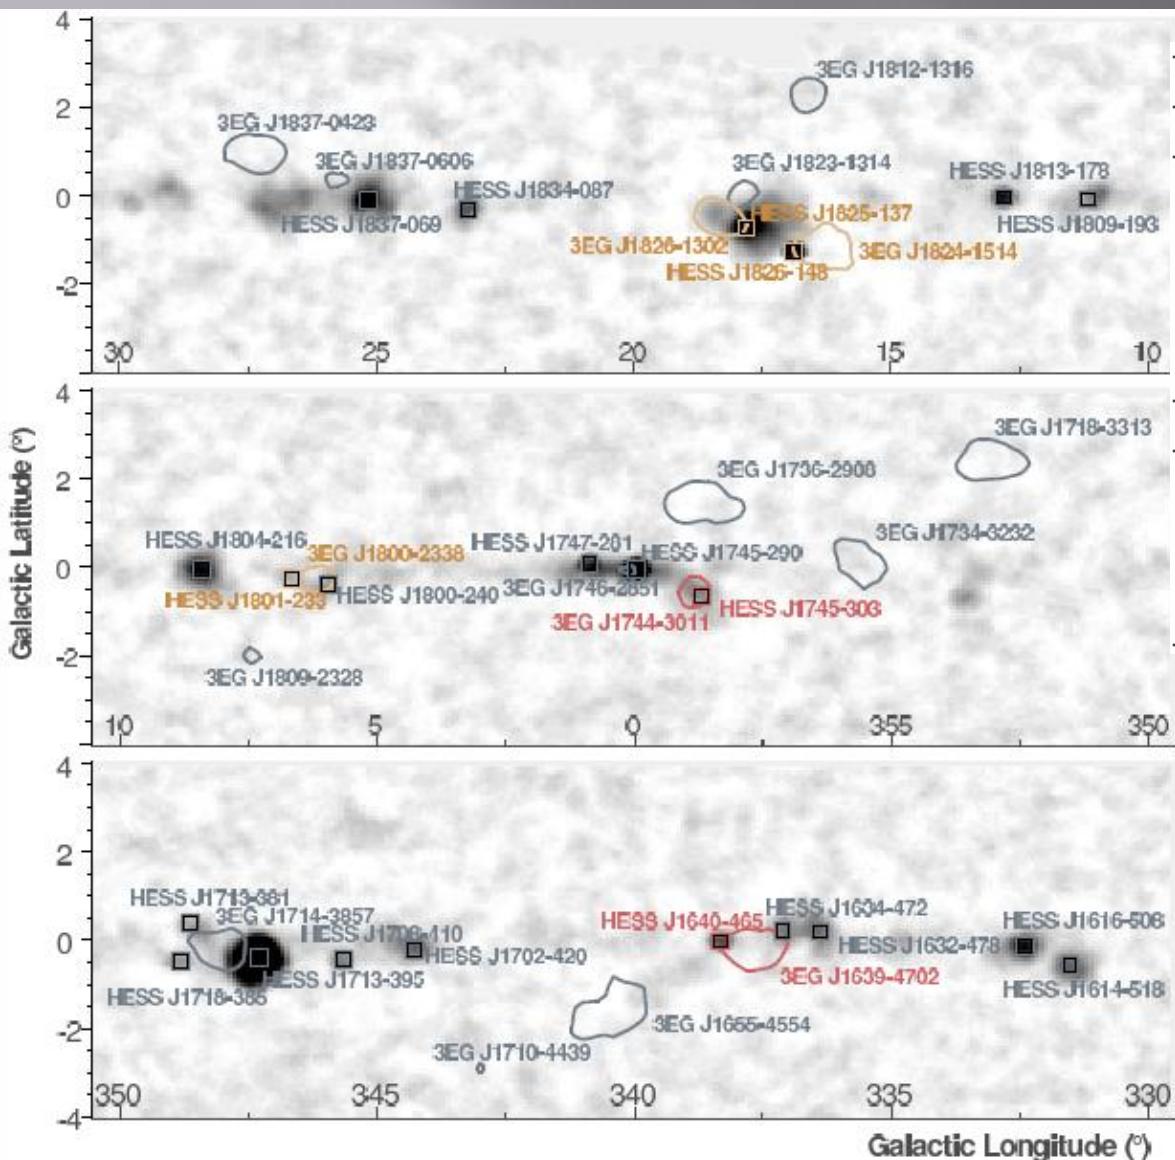

F. Aharonian et al., A&A 442, 1 (2005)

Two types:

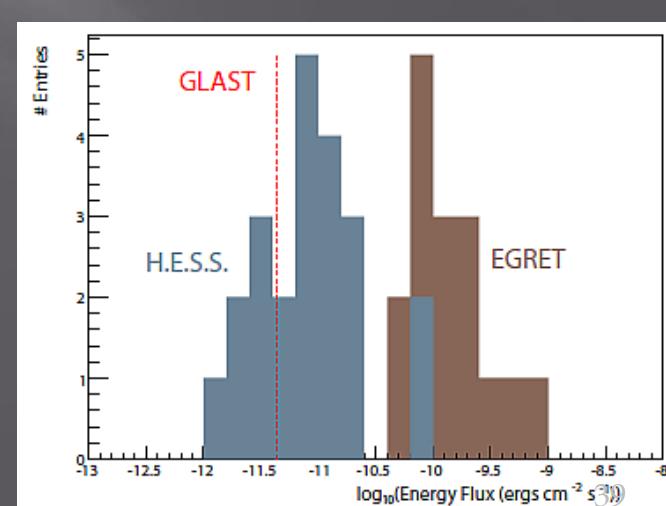

- 1) No compelling counterparts
- 2) Dark in other wavelengths

TeV-GeV relation?

Data: H.E.S.S. catalog

Summary

- High energy window of the Universe is now open!
 - Additional 2-3 decades of the photon spectrum
 - Wider variety of sources than expected
→ *Cosmic accelerators are ubiquitous!*
 - Much work left to understand their physics
 - Also: cosmology, fundamental physics
- Hoping to detect other class of sources...
 - Pulsars
 - Star-forming galaxies, mergers
 - Dwarf galaxies and dark matter
 - Ultraluminous IR galaxies
 - Clusters of galaxies
 - Gamma-ray bursts
